Orlando, Florida. March 2004

Purpose:

Discussion of new structure to consider for OFDMA AAS mode

Notice:

This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

IEEE 802.16 Patent Policy:

The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <<http://ieee802.org/16/ipr/patents/policy.html>>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <<mailto:chair@wirelessman.org>> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <<http://ieee802.org/16/ipr/patents/notices>>.

Modifications to AAS Mode for OFDMA

*Adam Kerr and Paul Petrus, ArrayComm
John Liebetreu and Randall Schwartz, Intel*

Motivation

- Propose changes to current AAS definition for OFDMA to:
 - work within OFDMA-1X scalable definition
 - resolve issues with current AAS Active DL scan
 - fit well within the existing map definitions in the standard

Current AAS Support in OFDMA

- Active AAS DL Scan
 - Fixed subchannel allocation
 - Iterates over up to 64 different TX strategies, indicating the following:
 - Private ranging allocation (subchannel, num symbols)
 - Private DL MAP allocation (subchannel, num symbols)
 - Concept:
 - SS detects a given “beam”
 - Performs ranging on an allocation using the same RX beam
 - Listens for DL MAP on an allocation using the same TX beam

Issues with Active AAS DL Scan

- Protocol specification includes specifics of implementation pertaining to DOA beamforming which should be removed
- Latency between scan and SS ranging or reception of DL MAP may be a serious problem for a mobility solution
- Vector channel response will vary over frequency, so private DL MAP may need a different TX strategy from the scan

Issues with Active AAS DL Scan

- Ranging solution is applicable only for TDD (assuming the BS actually does use a fixed uplink beam corresponding to the scanning downlink beam)
- Unclear if a transmit strategy has to be fixed with respect to the “beam index”. If so, the available transmit strategies are seriously limited.

Proposed Solution

- Redesign the existing AAS scan mode
- Design principles:
 - Range extension can be achieved only by matching the link budget of broadcast channel with that of directed unicast channel
 - Capacity enhancement can be achieved by supporting low reuse networks and SDMA
 - Mandates the need for unique preambles/training sequences in the uplink and downlink

Bridging Link Budget between Broadcast and Unicast

- Design Philosophy:
 - Minimize the information sent on the broadcast channel
 - Use beam-pattern diversity to obtain diversity gain and (partial) coherent combining gain
 - Use more coding on broadcast channel than the lowest modulation class on the traffic channel

Maps in AAS mode

- Maps in AAS mode should be transmitted as:
 - Broadcast maps (AAS-SICH)
 - Private maps
- AAS-SICH will carry information on:
 - Basic BS parameters (e.g. BSID, frame number)
 - Allocation for uplink network entry, uplink bandwidth request and uplink bandwidth.
- AAS-SICH needs a fixed subchannel allocation or an identifying preamble
- Maps are transmitted repeatedly with beam-pattern diversity

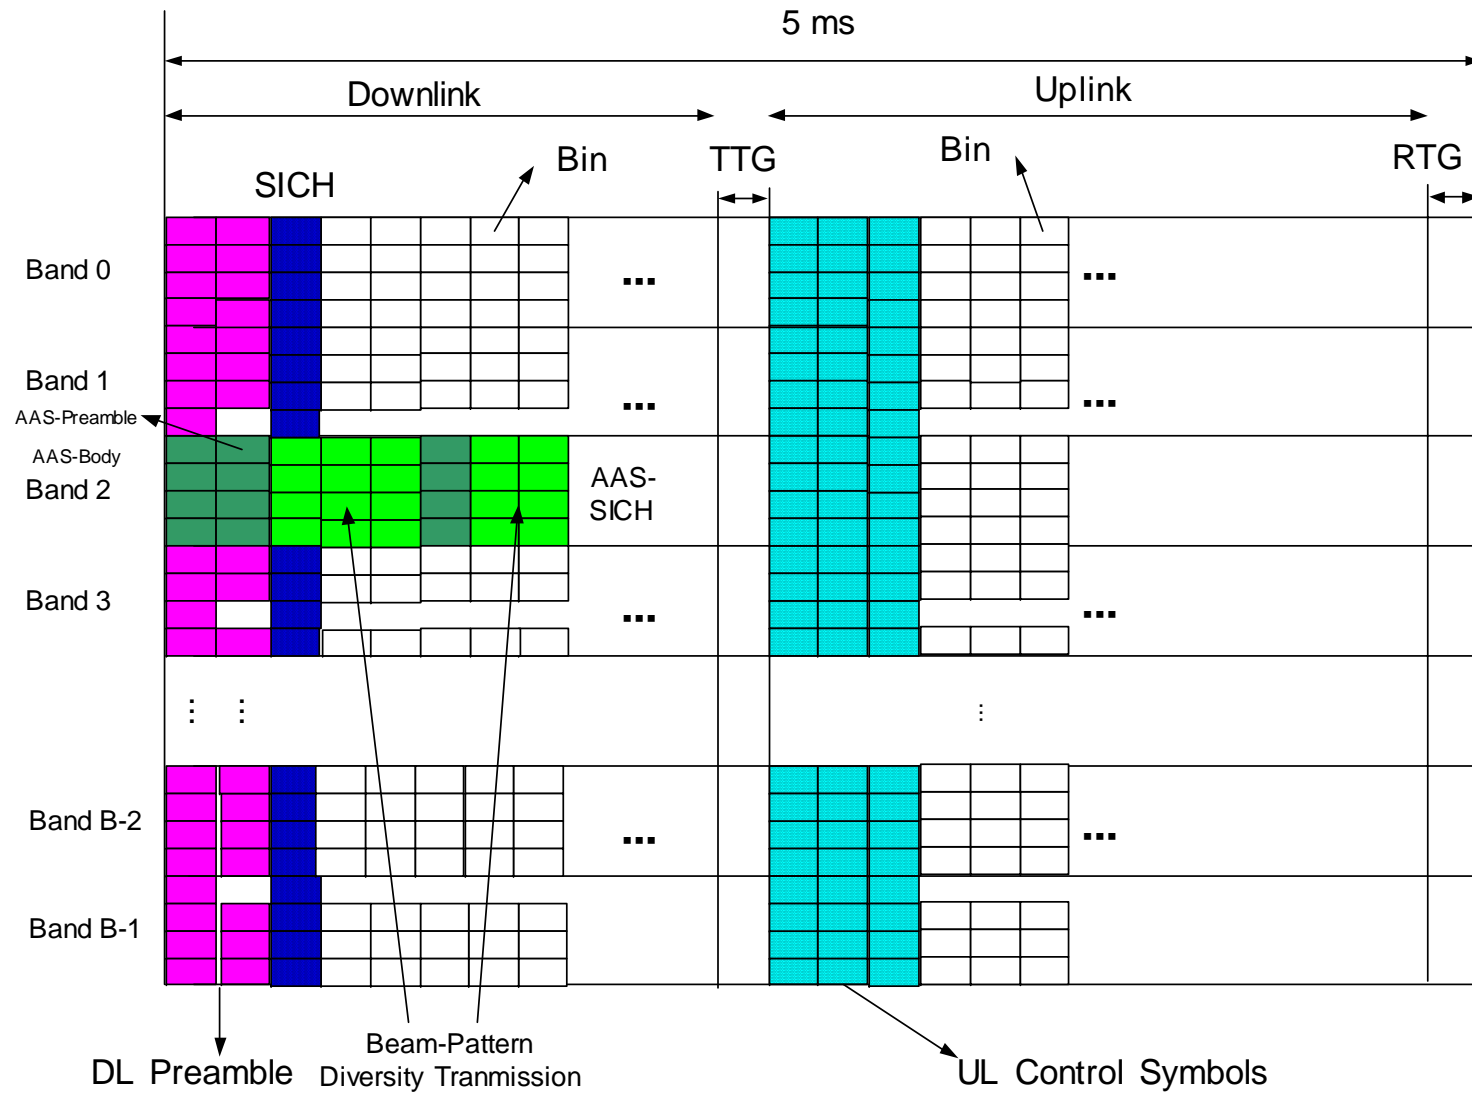

AAS Private Maps

- AAS private mode will carry all other information for the maintenance of further communication between the BS and SS.
- AAS private mode will be on directed unicast channels.
- Directed downlink maps are sent upon receiving an uplink transmission enabling the BS beamformer to estimate the propagation channel and interference environment

Dedicated AAS-SICH

- A dedicated AAS-SICH to carry broadcast maps is introduced.
- Use one or more AMC subchannels to form AAS-SICH carrying:
 - Basic BS parameters (e.g. BSID, frame number)
 - Allocation for uplink network entry, uplink bandwidth request and uplink bandwidth
- SS listens to AAS-SICH and then gains uplink access on the assigned subchannel

Example AAS-SICH Layout

Private Maps

- SS receives further DL maps in the private mode in the directed traffic channel
- Directed map in the current DL frame may be used for assignment either in the current frame or future frame.

Capacity Enhancement

- AAS should perform interference nulling both in the uplink and downlink
- To enable nulling, user signals need to be uniquely identified
- Unique preambles are required in the uplink and downlink

Preamble Design

- A small set of distinct preambles need to be designed to support reuse planning
- Preambles will be assigned as a function of BSID and CID

Specific Text Changes

- TBD

Summary

- Significant changes to the AAS mode in the 802.16 OFDMA PHY is needed
- A scheme using beam-pattern diversity, compressed broadcast map and private maps is required to bridge the gap in link budget between broadcast and unicast
- Distinct preambles need to be designed for uplink and downlink to operate in low reuse networks
