Re:	This is a response to a Call for Comments on IEEE P802.16e-D5a
Abstract	STC sub-packet combining scheme can be applied with adaptive antenna grouping in OFDMA
Purpose	This document is submitted for review by 802.16e Working Group members
Notice	This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.
Patent Policy and Procedures	The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>.

STC sub-packet combining with antenna grouping for 3 and 4 transmit antennas in OFDMA

Bin-chul Ihm, Jinyoung Chun and Yongseok Jin
LG Electronics

1. Introduction

1.1 STC subpacket combining

In OFDMA of the current 802.16 standard, STC sub-packet retransmission schemes for 2, 3 and 4-antenna spatial multiplexing scheme are provisioned in section '8.4.8.9 STC sub-packet combining'. This scheme gives the efficient retransmission in the low mobility because the pairs of transmit antennas consist of STTD structure.

Received signal with the initial and retransmission packets are written as follows:

$$x_{init} = H_{init}\, s + v_1$$
$$x_{retx} = H_{retx}\, s_{retx} + v_2$$

where $\begin{bmatrix} s & s_{retx} \end{bmatrix} = \begin{bmatrix} s_1 & -s_2^* \\ s_2 & s_1^* \\ s_3 & s_3^* \end{bmatrix}$ for 3 tx antenna and $\begin{bmatrix} s & s_{retx} \end{bmatrix} = \begin{bmatrix} s_1 & -s_2^* \\ s_2 & s_1^* \\ s_3 & -s_4^* \\ s_4 & s_3^* \end{bmatrix}$ for 4 tx antennas as shown in table 315m

and 315n. In the current specification, the retransmission subpacket has a fixed form as above, however, retransmission subpacket format adaptation according to channel condition can improve the system performance. There are two more alternative retransmission formats in 3 and 4 transmit antennas system as follows:

For 3 transmit antenna system, $\text{Default}: \begin{bmatrix} -s_{i+2}^* \\ s_{i+1}^* \\ s_{i+3}^* \end{bmatrix}$, $\text{Alternative}\,1: \begin{bmatrix} -s_{i+3}^* \\ s_{i+2}^* \\ s_{i+1}^* \end{bmatrix}$, $\text{Alternative}\,2: \begin{bmatrix} s_{i+1}^* \\ -s_{i+3}^* \\ s_{i+2}^* \end{bmatrix}$

For 4 transmit antenna system, $\text{Default}: \begin{bmatrix} -s_{i+2}^* \\ s_{i+1}^* \\ -s_{i+4}^* \\ s_{i+3}^* \end{bmatrix}$, $\text{Alternative}\,1: \begin{bmatrix} -s_{i+3}^* \\ -s_{i+4}^* \\ s_{i+1}^* \\ s_{i+2}^* \end{bmatrix}$, $\text{Alternative}\,2: \begin{bmatrix} -s_{i+4}^* \\ -s_{i+3}^* \\ s_{i+2}^* \\ s_{i+1}^* \end{bmatrix}$

1.2 ACK/NACK Signaling with alternatives

To send back one of alternatives with NACK signal, it is required to add the two values to current ACK/NACK values. Then there are four values indicating ACK, NACK, NACK with alternative 1 and NACK with alternative 2.

2. Proposed Text Change

[Modify Table 315m and Table 315n in section 8.4.8.9 STC subpacket combining]

Table 315m – STC subpacket combining (3–transmit antenna case)

	Initial transmission	Odd re-transmission	Even re-transmission
Space time code incremental redundancy for matrix C	$S^{(0)} = \begin{bmatrix} s_1 \\ s_2 \\ s_3 \end{bmatrix}$	$S^{(odd)} = \begin{bmatrix} -s_2^* \\ s_1^* \\ s_3^* \end{bmatrix}$ (Default) $S^{(odd)} = \begin{bmatrix} -s_3^* \\ s_2^* \\ s_1^* \end{bmatrix}$ (Alternative 1) $S^{(odd)} = \begin{bmatrix} s_1^* \\ -s_3^* \\ s_2^* \end{bmatrix}$ (Alternative 2)	$S^{(even)} = \begin{bmatrix} s_1 \\ s_2 \\ s_3 \end{bmatrix}$

Table 315n – STC subpacket combining (4 –transmit antenna case)

	Initial transmission	Odd re-transmission	Even re-transmission
Space time code incremental redundancy for matrix C	$S^{(0)} = \begin{bmatrix} s_1 \\ s_2 \\ s_3 \\ s_4 \end{bmatrix}$	$S^{(odd)} = \begin{bmatrix} -s_2^* \\ s_1^* \\ -s_4^* \\ s_3^* \end{bmatrix}$ (Default) $S^{(odd)} = \begin{bmatrix} -s_3^* \\ -s_4^* \\ s_1^* \\ s_2^* \end{bmatrix}$ (Alternative 1) $S^{(odd)} = \begin{bmatrix} -s_4^* \\ -s_3^* \\ s_2^* \\ s_1^* \end{bmatrix}$ (Alternative 2)	$S^{(even)} = \begin{bmatrix} s_1 \\ s_2 \\ s_3 \\ s_4 \end{bmatrix}$

[***Apply the following into the 8.4.5.4.17 Optional Enhanced UL ACK channels***]

8.4.5.4.17 Optional Enhanced UL ACK channels

The uplink ACK (Acknowledgement) provides feedback for Downlink Hybrid ARQ. This channel shall only be supported by MSS supporting H-ARQ. The MSS transmits ACK or NAK feedback for Downlink packet data. One ACK channel occupies a half subchannel, which is 3 pieces of a 3x3 uplink tile in the case of optional PUSC or 3 pieces of a 4x3 uplink tile in the case of PUSC. The acknowledgement ~~bit~~ of the n-th ACK channel shall be ~~'0' (ACK)~~`ACK' if the corresponding downlink packet has been successfully received; otherwise, it shall be ~~'1' (NAK)~~`NAK'. This ~~1 bit~~ acknowledgement is encoded into a length 3 codeword over an 8-ary alphabet for the error protection as shown in Table 298c.

Table 298c-ACK channel subcarrier modulation

ACK ~~1 bit~~ Symbol	Vector Indices per Tile Tile(0), Tile(1), Tile(2)
ACK	0,0,0
NACK (Default for H-ARQ mode=Generic)	4,7,2
NACK with alternative 1 (if H-ARQ mode=Generic)	2,3,4,
NACK with alternative 2(if H-ARQ mode=Generic)	3,6,5

3. Simulation results

In the simulation, we used convolutional code 1/2, QPSK symbols, 3 transmit and 3 receive antennas in band-AMC mode. As shown in Figure 1, the proposed scheme gives the performance gain about 1.5dB over the current STC combining scheme at BLER 10^{-2}. This gain holds when delay is 4 frames as shown in Figure 2.

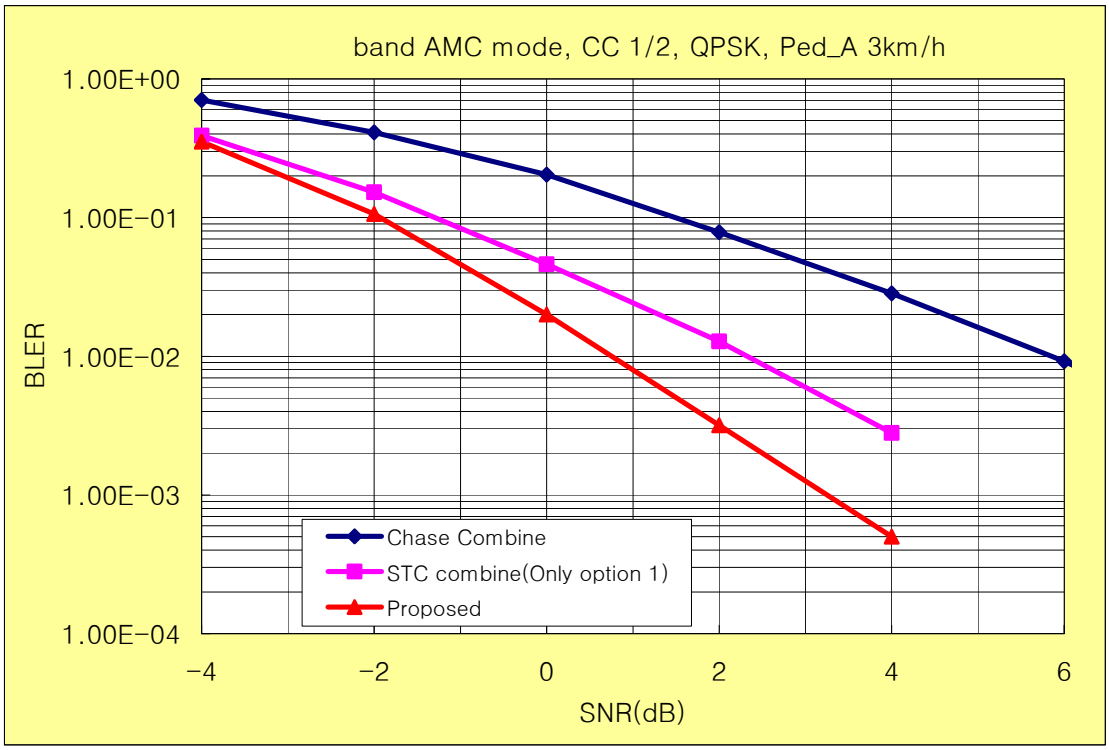

Figure 1. Performance comparison in Ped_A(3km/h) with delay=1

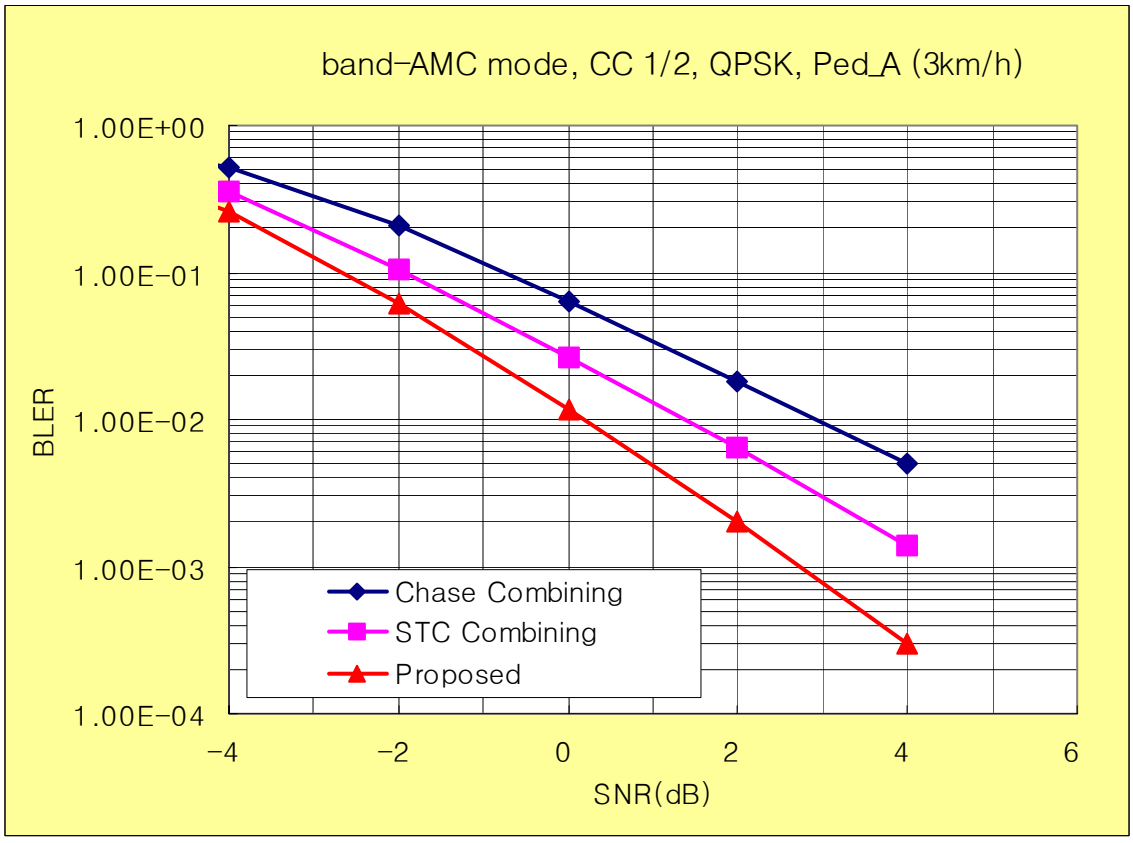

Figure 2. Performance comparison in Ped_A(3km/h) with delay=4
