Re:	Contribution supporting Sponsor ballot
Abstract	System parameters to support public cellular operation and scalability
Purpose	Adopting of proposed system parameters into P802.16e
Notice	This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.
Patent Policy and Procedures	The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures (Version 1.0) < http://ieee802.org/16/ipr/patents/policy.html >, including the statement "IEEE standards may include the known use of patent(s), including patent applications, if there is technical justification in the opinion of the standards-developing committee and provided the IEEE receives assurance from the patent holder that it will license applicants under reasonable terms and conditions for the purpose of implementing the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair < mailto:r.b.marks@ieee.org > as early as possible, in written or electronic form, of any patents (granted or under application) that may cover technology that is under consideration by or has been approved by IEEE 802.16. The Chair will disclose this notification via the IEEE 802.16 web site < http://ieee802.org/16/ipr/patents/notices >.

FFT size and subchannelization for scalability

Problem Definition and Proposed Solutions

In order to operate the system specified in IEEE 802.16e/D2 in a public cellular network supporting full mobility, the basic system parameters i.e., system bandwidth, FFT size, and subchannelization should be modified or included in [1].

The solution falls into three categories:

Bandwidth

To meet the requirements from service providers who would like to deploy a high speed public cellular network, the system bandwidths 1.25 and 2.5MHz options should be included.

FFT Size

In order to support full mobility with low overhead for CP duration, the FFT size corresponding to the bandwidth should be scalable, i.e., 128-FFT for 1.25 MHz BW, 256-FFT for 2.5 MHz BW, 512-FFT for 5 MHz, 1024-FFT for 10 MHz BW, and 2048-FFT for 20 MHz BW.

Subchannelization

In order to support various FFT sizes for corresponding bandwidths, the subchannelization for downlink and uplink should be modified accordingly.

Suggested change to the standard

(1) In ‘8.4.1 Introduction’, CHANGE the paragraph in page 72 line 21 as “The mandatory OFDMA PHY mode that shall be supported by all SS is based on a 2048-FFT. Other FFT sizes may optionally be employed as well. These FFT sizes are scalable to the channel BW in which they are being used, i.e., [128-FFT for 1.25 MHz channel BW](#), [256-FFT for 2.5 MHz channel BW](#), 512- FFT for 5 MHz channel BW or less and 1024-FFT for 10 MHz channel BW or less.”

(2) ADD the [Table 1~Table 5](#) at section ‘8.4.6.1.4 Additional optional symbol structure for FUSC’.

Table 1. Optional 128-FFT OFDMA downlink carrier allocations

<u>Parameters</u>	<u>Value</u>	<u>Comments</u>

<u>Number of Data Subcarriers</u>	<u>1536</u>	
<u>Number of Data Subcarriers per Subchannel</u>	<u>48</u>	

(3) REPLACE section ‘8.4.6.1.4.1 Downlink subchannel subcarrier allocation’ with the following text:

To allocate the diversity subchannels, the whole data tones in a symbol are partitioned into groups of contiguous data subcarriers. Each subchannel consists of one subcarrier from each of these groups. The number of groups is therefore equal to number of data subcarriers per subchannel, and its value is 48. The number of the subcarriers in a group is equal to the number of subchannels, say N_s . As shown in Table 6, N_s is determined by FFT size. The exact partitioning into subchannels is according to Equation (1), called DL permutation formula.

$$Carrier(s, m) = \begin{cases} N_s \times k + \left[s + P_{1,c_1}(k') + P_{2,c_2}(k') \right]_2 & 0 < c_1, c_2 < N_s \\ N_s \times k + \left[s + P_{1,c_1}(k') \right]_2 & c_1 \neq 0, c_2 = 0 \\ N_s \times k + \left[s + P_{2,c_2}(k') \right]_2 & c_1 = 0, c_2 \neq 0 \\ N_s \times k + s, & c_1 = 0, c_2 = 0 \end{cases} \quad (1)$$

where

$Carrier(s, m)$ = subcarrier index of m -th subcarrier in subchannel s

$k = (m + s * 23) \text{ mod } 48, k' = k \text{ mod } (N_s - 1)$

m = subcarrier-in-subchannel index from the set [0 ~ 47]

s = index number of a subchannel from the set [0 ~ N_s-1]

$P_{1,c_1}(j)$ = j -th element of the sequence obtained by rotating basic permutation sequence P_1 cyclically to the left c_1 times. See Table 6.

$P_{2,c_2}(j)$ = j -th element of the sequence obtained by rotating basic permutation sequence P_2 cyclically to the left c_2 times. See Table 6.

$c_1 = ID_{cell} \text{ mod } N_s, c_2 = \lfloor ID_{cell} / N_s \rfloor, 0 \leq c_1, c_2 < N_s$

In Equation (1), the operation in [] is done over $GF(N_s)$. In $GF(2^n)$, addition is binary XOR operation. For example, $13 + 4$ in $GF(2^n)$ is $[(1101)_2 \text{ XOR } (0100)_2] = (1001)_2 = 9$, where $(x)_2$ represents binary expansion of x .

(5) REPLACE section ‘8.4.6.2.4.2 Partitioning of subcarriers into subchannels in the uplink’ with the following text:

To allocate the subchannels, N_{used} subcarriers are partitioned into tiles which is 3x3 frequency-time block containing 9 tones(1 pilot tones and 8 data tones). The whole frequency bands are partitioned into groups of contiguous tiles. Each subchannel consists of 6 tiles each of which is chosen from different groups. Let us denote the number of tiles in a group by N_s . N_s is different according to FFT size.

There are 18 groups in the whole frequency band and the number of tiles in a group is N_s . In order to make a subchannel, 6 groups at equal distance(3 groups away from each) are chosen and each of 6 tiles is selected from each group.

The exact partitioning into subchannels is according to Equation (2), called UL permutation formula.

$$Tile(s,m) = \begin{cases} 3N_s \cdot m + N_s \cdot S + \lfloor s' + P_{1,c_1}(m') + P_{2,c_2}(m') \rfloor & 0 < c_1, c_2 < N_s \\ 3N_s \cdot m + N_s \cdot S + \lfloor s' + P_{1,c_1}(m') \rfloor & c_1 \neq 0, c_2 = 0 \\ 3N_s \cdot m + N_s \cdot S + \lfloor s' + P_{2,c_2}(m') \rfloor & c_1 = 0, c_2 \neq 0 \\ 3N_s \cdot m + N_s \cdot S + s', & c_1 = 0, c_2 = 0 \end{cases} \quad (2.)$$

where

$Tile(s, m)$ = tile index of m -th tile in subchannel s .

$$S = \lfloor s / N_s \rfloor, s' = s \bmod N_s$$

m = tile-in-subchannel index from the set $[0 \sim 5]$, $m' = m \bmod (N_s - 1)$

s = index number of a subchannel from the set $[0 \sim 3N_s - 1]$

$P_{1,c_1}(j)$ = j -th element of the sequence obtained by rotating basic permutation sequence P_1 cyclically to the left c_1 times. See Table 6

$P_{2,c_2}(j)$ = j -th element of the sequence obtained by rotating basic permutation sequence P_2 cyclically to the left c_2 times. See Table 6

$$c_1 = ID_{cell} \bmod N_s, c_2 = \lfloor ID_{cell} / N_s \rfloor$$

In Equation (4), the operation in $\lfloor \rfloor$ is over $GF(2^n)$. In $GF(2^n)$, addition is binary XOR operation. For example, $13 + 4$ in $GF(2^n)$ is $[(1101)_2 \text{ XOR } (0100)_2] = (1001)_2 = 9$, where $(x)_2$ represents binary expansion of x .
