4 Subject: Re: [RPRWG] ConservativeRate SM questions
5
6 Guoliang,
7
8 Initially, the condition in row 5 was as you suggested
9 (i.e., $\text{localFairRate} \geq \text{unreservedRate}[\text{myRi}]$).
10 However, when people from AT&T simulated a scenario
11 where localWeight of the head node was greater than 1,
12 the head of the congested domain was observed to go
13 out of the congested state prematurely and leaving
14 some unused ring bandwidth. That is why they suggested
15 using $\text{localFairRate}/\text{localWeight} \geq$
16 $\text{unreservedRate}[\text{myRi}]$), which had resolved the problem.
17
18 I hope that this helps.
19
20 BTW: As Mike mentioned in his e-mail, what I wrote
21 was/is my opinion and it needs to be agreed by the
22 group.
23
24 Thanks,
25
