Transmit Power Back-off (PBO) for 2.5G and 5G BASE-T

Why Power Back-off is Needed

- Transmit power back-off (PBO) is a mechanism to alleviate the effect of alien crosstalk
- Alien crosstalk is stronger when a remote aggressor is on a shorter cable and closer to a victim
- PBO reduces the transmit power on short cables so that the crosstalk to adjacent links is reduced

Alien Crosstalk in BASE-T Systems

- Alien crosstalk is stronger when
 - Signaling bandwidth is wider
 - Coupling between cables is stronger
- Alien crosstalk is considered negligible in 1000BASE-T due to low bandwidth and low SNR requirements
 - Annex 40A defines a limit on ANEXT for 1000BASE-T systems
- 10GBASE-T is very sensitive to alien crosstalk because of its wider bandwidth. Coping mechanisms:
 - Use of Cat6a with lower coupling factor
 - PBO
- Alien crosstalk is an important noise source in 2.5G and more so in 5GBASE-T because
 - Cat5e/Cat6 cables have higher coupling factor
 - Signaling bandwidth is fairly wide

Alien Crosstalk PSD in 10GBASE-T

- ANEXT power is mostly independent of cable length
- AFEXT varies with insertion loss and coupling length

PBO in 10GBASE-T

- Alien crosstalk may be equalized across cable lengths with proper back-off of transmit power on shorter cables
- 10GBASE-T allows up to 14 dB of PBO in steps of 2 dB

PBO Selection Criterion in 10G

- Reduce the transmit power on shorter cables
 - so that the crosstalk on longer victim is minimized
 - while the SNR on shorter cables is no sacrificed too much
- SNR should remain above a target for any combination of victim and aggressors cable lengths

PBO Considerations in 5G/2.5G

 There is no limit-line or model for alien crosstalk of Cat5e and Cat6 cables

- Usage model for 5G/2.5G allows mixture of victim and aggressors with potentially different rates and PSDs
- Aggressors and victim can be any combination of the following rates:
 - 1000BASE-T: BW=62.5 MHz, no PBO
 - 2.5GBASE-T: BW=100 MHz
 - 5GBASE-T: BW=200 MHz

Alien Crosstalk Models for Cat6/5e

• For this analysis, Cat6a models are extended with an additional constant offset

$$ANEXT_{PS} = \begin{cases} X_n - 10 \times \log(f/100) - X_o & f < 100 \text{ MHz} \\ X_n - 15 \times \log(f/100) - X_o & f \ge 100 \text{ MHz} \end{cases}$$

 $AELFEXT_{PS} = X_f - 20 \times log(f/100) - 10 \times log(L/100) - X_o$

- X_f and X_n are alien crosstalk loss of Cat6a at 100 MHz
- X_o is the offset of Cat6/5e from Cat6a
 - An offset of $X_o \approx 15 \text{ dB}$ is used as the starting point
 - Do we need different offset for ANEXT and AFEXT?

Alien Crosstalk PSD for Various Rates

SNR Analysis

- Cable: Cat5e with alien crosstalk offset of 15 dB
- Transmit power:
 - 5G/2.5G: 2 dBm
 - 1G: 3.5 dBm (no spec, based on modeling and measurement)
- Bandwidth
 - 5G: 200 MHz
 - 2.5G: 100 MHz
 - 1G: 62.5 MHz
- Background thermal noise: -150 dBm/Hz
 - Implementation-depended noise sources are not included
- Mixed aggressor model: each of 6 aggressors contributes 1/6 to the total crosstalk power

Salz SNR: 5G/2.5G over 100m – No PBO

Salz SNR: 1G over 100m

1000BASE-T is immune to 5G and 2.5G aggressors!

SNR, PBO and Crosstalk Offset

- Increasing the transmit power of the victim increases the SNR of the victim
- Increasing the transmit power of the aggressors reduces the SNR of the victim
- Increasing the alien crosstalk offset reduces the SNR of the victim

PBO Selection Algorithm

- Find the PBO and the alien crosstalk offset for each length and rate such that:
 - SNR of both victim and aggressors always remain above the target level
 - Crosstalk offset is maximized (*i.e.* widest support of cable plants in the field)
 - Maximum transmit power remains below a limit
- Other considerations:
 - Transmit power in 1G is fixed
 - Mixture of various aggressor rates

Optimal PBO and Crosstalk Offset

Minimum SNR Victim: 100m Cat5e , Aggressors: Mixed

PBO: 2 dB Steps

PBO Table

5G						
Receive Power (dBm)	Cable Length (m)	PBO (dB)				
$-5.8 \le P$	$L \leq 35$	8				
$-7.0 \le P < -5.8$	$35 < L \le 45$	6				
$-9.2 \le P < -7.0$	$45 < L \le 65$	4				
$-11 \le P < -9.2$	$65 < L \le 85$	2				
P < -11	85 < L	0				

2.5G					
Receive Power (dBm)	Cable Length (m)	PBO (dB)			
$-4.3 \le P$	$L \le 45$	2			
P < -4.3	45 <i>< L</i>	0			

Summary

- 5G:
 - PBO is necessary
 - A maximum of 8 dB back-off is sufficient
 - Supported alien crosstalk offset from 11 dB on long cables to more than 18 dB on short cables
- 2.5G
 - PBO is beneficial particularly for 5G operation
 - A maximum of 2 dB back-off is sufficient
 - Supported range for alien crosstalk offset is from 18 to 26 dB
- 1G is insensitive to alien crosstalk from 2.5G and 5G transceivers

PBO in 10GBASE-T

The PBO is specified based on received power

Power backoff schedule in 10GBASE-T								
Cable Length (m)	35	45	55	65	75	100		
Power Backoff (dB)	10	8	6	4	2	0		

• The power number in the PBO table for 10GBASE-T seems to be wrong!
