

Link budget analysis for technical feasibility assessment

Rubén Pérez-Aranda
rubenpda@kdpof.com

Introduction

- Based on Shannon's capacity analysis and simulation models of the different components that compose the communication channel, the receiver sensitivity and link budget is calculated for different conditions and data-rates
- Frequency-domain linear simulation models are assumed for Shannon's analysis
- Non-linear time-domain models of VCSEL have been matched with real measurements
- Implementation losses have been estimated based on time-domain stochastic simulations and applied afterwards to Shannon simulations
 - RIL = 0.4 dB
- Finite equalizer implementation, clock jitter, finite sampling precision (ENOB), and finite DSP arithmetic resolution are additionally included
- Frame structure with real overheads (e.g. PCS encoding, FEC, OAM, etc) has been considered as well as training / tracking PHY states for timing-recovery and equalization
- Link budgets are only reported in the worst case: $T_s = 125^\circ\text{C}$ (substrate)
- Method is according to "*perezaranda_OMEGA_01b_0919_techfeasibility.pdf*"

Worst/case in datacenter applications

Two grades of connectivity are defined with expected different tolerances and relative cost.

Grade and acceptable relative cost is expected to scale with data-rate.

Conclusions

- Data-rates of 2.5, 5 and 10 Gb/s over at least OM1 based link segments with up to 4 inline connectors and 40 meters have been demonstrated feasible at $T_{S(\text{VCSEL})} = T_{J(\text{PD/TIA})} = 125^{\circ}\text{C}$ using low current density VCSEL driving and optical connectivity grade 2
- Data-rates of 25 Gb/s over at least OM2 based link segments with up to 4 inline connectors and 15 meters have been demonstrated feasible at $T_{S(\text{VCSEL})} = T_{J(\text{PD/TIA})} = 125^{\circ}\text{C}$ using low current density VCSEL driving and optical connectivity grade 1
- Data-rates of 25 Gb/s over at least OM3 based link segments with up to 4 inline connectors and 40 meters have been demonstrated feasible at $T_{S(\text{VCSEL})} = T_{J(\text{PD/TIA})} = 125^{\circ}\text{C}$ using low current density VCSEL driving and optical connectivity grade 1
- Both optical connectivity grades 1 and 2 are much worse than any real implementation used today in datacenter applications
