33.7.x.y Reduced operation PD power value field

The reduced operation PD power value field may optionally contain a PD power value that is a lower PD power value than the actual PD power value, as specified in 33.7.2.4. This reduced operation PD power value represents a power state in which the PD could continue to operate, but with less functionality than currently at the actual PD power value. The PSE could optionally use this information in the event that the PSE subsequently requests a lower PD power value than the actual PD power value.

The PD power value, as defined in Table 33-23, is encoded according to formula 33-16. The default value for this field is FFFF.
