3.1.6 the xMII is driven by the RS layer not the MAC.

SuggestedRemedy

Change definition as follows... Change "the MAC may stop" to "the RS may stop". Change "the MAC does not support" to "the PHY does not support".

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.4.1.3a** *P* **121** *L* **26** # 157

Brown, Matthew Applied Micro (AMCC)

Comment Type **GR** *Comment Status* **X**

I assume that this is the PHY XS transmit clock (TX_CLK) which attaches to the PCS receive clock (RX_CLK). Make this clear.

SuggestedRemedy

Change "the PHY XS may stop the transmit xMII clock" to "the PHY XS may stop the PHY_XS transmit (or PCS receive) xMII clock from the attached PCS". Change "stop the receive clock" to "stop the PHY_XS transmit clock". Need statement in Clause 48.

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.4.1.3a** *P* **121** *L* **26** # 106

Horner, Rita Avago Technologies

Comment Type **TR** *Comment Status* **X**

The text is a bit confusing. "If bit 4.0.10 is set to 1 then the PHY XS may stop the transmit xMII clock while it is signaling LPI otherwise it shall keep the clock "active. If the PHY XS does not support EEE capability or is not able to stop the receive clock then this bit has no effect". Is this to stop TX_CLK or RX_CLK @ XGMII interface?

SuggestedRemedy

Change the text for better clarity.

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.4.1.3a** *P* **121** *L* **28** # 73

Turner, Edward J Gnodal Ltd

Comment Type **T** *Comment Status* **X**

Incorrect reference to 'receive clock'. The PHY XS only has the capability to stop the transmit clock (as discussed in the previous sentence of this sub clause).

SuggestedRemedy

Change 'receive' to 'transmit'.

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.4.1.3b** *P* **121** *L* **32** # 107

Horner, Rita Avago Technologies

Comment Type **TR** *Comment Status* **X**

In the statement: "If bit 4.0.9 is set to 1 then the PHY XS may stop signaling on the XAUI in the receive direction during LPI
. . . ", is the bit 4.0.9 to stop XAUI signaling going out from the PHY? How would this correlates to XAMII clock? Disabling the interface clock does not gurantee that the low power mode is entered for all applications.

SuggestedRemedy

Suggest to remove the correlation between clock disable and data disable during LPI mode.

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.4.1.3b** *P* **121** *L* **34** # 74

Turner, Edward J Gnodal Ltd

Comment Type **T** *Comment Status* **X**

Incorrect reference to 'receive clock'. This register bit controls stopping XAUI signalling, rather than clocks.

SuggestedRemedy

Change 'receive clock' to 'receive path XAUI signals'.

Proposed Response *Response Status* **O**

Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

In Figure 49-17, there is a problem with the mechanism described to recover from a wake time fault. The variable energy_detect is used to determine if the transmitter has returned to the quiet state. This requires capabilities beyond what is otherwise assumed for 10GBASE-KR energy_detect. Per 72.6.4 (page 236, line 26), the value of PMD signal_detect is determined by the 10GBASE-KR training state diagram (in other words, it is set to TRUE) when rx_mode is DATA. Since rx_mode is set to DATA in the RX_WAKE state, and not changed upon a transition to the RX_WTF state, the branch to the RX_QUIET state can never be taken. Also note energy_detect has been defined as a mechanism to detect the transmitter's transition from TX_QUIET to TX_ALERT (it is only enabled during rx_mode = QUIET) and a special alert signal has been defined to facilitate this. The energy_detect variable should not be assumed to be a general indication of signal presence (or absence). If there is no robust means to distinguish between a quiet and an active line, then this transition has little value. It may be more reasonable to extend the refresh time to give the receiver a reasonable chance to recover before the line goes quiet again. If the receiver is unable to recover, then it is likely the link needs to fully retrained and therefore be taken down.

SuggestedRemedy

Remove the transition from RX_WTF to RX_QUIET. Consider extending the refresh time to give the receiver a longer opportunity to recover from a wake time fault during refresh.

Comment Type **TR** *Comment Status* **X**

For the case where signal_ok is generated by the PMA sublayer (i.e. no FEC sublayer in the stack), it seems that more is being read into the meaning of this variable than what is actually defined. In the RX_SLEEP state, rx_mode is set to DATA which means that, per 72.6.4, signal_detect is determined by the 10GBASE-KR training state diagram (e.g. it is TRUE). Per 51.4.1, the PMA qualifies this signal with the optional PMA loopback signal (irrelevant) or the optional Sync_Err function. Even when implemented, the Sync_Err function is defined to report TRUE when there is a synchronization error but it is also stated that a value of FALSE does not guarantee synchronization. Therefore, the PMA signal_ok signal does not appear to be a sufficiently robust indicator of the absence of an input signal.

SuggestedRemedy

Change the condition for the transition from RX_SLEEP to RX_QUIET to be !rx_tq_timer_done * !rx_block_lock. Since !signal_ok also forces rx_block_lock to be FALSE, the intended behavior is preserved if signal_ok behaves as assumed by the current state diagram. If signal_ok is not a robust indicator of the absence of the signal, then loss of block lock provides a fail-safe to ensure the receiver enters the RX_QUIET state. This works equally well when the FEC sublayer is included.

Proposed Response *Response Status* **O**

Cl **49** *SC* **49.2.13.3.1** *P* **174** *L* **37** # 124

Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

The values for TWR (for both scr_bypass_enable = FALSE are TRUE) are too large. The values significantly exceed minimum MAC transmit deferral time Tw_sys_tx defined in Table 78-4. This implies that the packet (or packets) transmitted immediately follow the minimum deferral time will disappear and no error will be recorded to account for their absence. Note that rx_lpi_active remains TRUE until the wake is successful (i.e. a transition to the RX_ACTIVE state). As long as rx_lpi_active is TRUE, the PCS receive state diagram cannot leave the RX_LI state which means any data received while the PHY is in the process of waking will be swallowed by the PHY and only LPI will be presented at the receive XGMII. Because of this, it is critical that the PHY count wake errors to account for any disappearance of packets. The times were initially extended to provide for the case of a WAKE directly from refresh. This is a non-issue when the FEC sublayer is not included in the PHY stack (the receiver will either transition to RX_ACTIVE directly or via RX_SLEEP and there will be no wake time fault) . When FEC is included, it may be an issue since entry into x_SCR_BYPASS may delayed which will in turn delay rx_block_lock. This issue is readily addressed by a simplification of the Transmit LPI state diagram where a refresh is rendered as the sequence TX_ALERT -> TX_WAKE -> [TX_SCR_BYPASS] -> TX_SLEEP. The existing transition from TX_SLEEP to TX_ACTIVE addresses "wake from refresh" events. Such a change greatly simplifies the state diagram, allows the definition of T_WR values that enable the correct counting of wake errors, and ensures that entry into TX_SCR_BYPASS occurs on a consistent schedule for any series of refresh, wake, or wake from refresh events.

SuggestedRemedy

A presentation will be submitted that proposed a new Transmit LPI state machine that addresses the core issue and revises the TWR values.

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Michael Grimwood. Clarify that the transition to PCS_Test serves as the fixed timing reference for LPI refresh signaling in fast retraining (as well as initial training and normal retraining).

SuggestedRemedy

In Section 55.3.4a.1, page 194 line 9 Change: "As in training without the EEE capability, the master and slave signal when they will transition to PCS_Test
using the transition counter following the procedure described in 55.4.2.5.14." To: " In initial training, normal retraining, and fast retraining, with or or without the EEE capability being supported, the master and slave signal when they will transition to PCS_Test using the transition counter following the procedure described in 55.4.2.5.14."

Proposed Response *Response Status* **O**

Cl **55** *SC* **55** *P* **201** *L* **2** # 363

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Michael Grimwood. 55.3.5.4 The expected behavior of the PCS 64/65B Transmit state diagram during fast retraining is not clear. Propose to hold the diagram in TX_INIT when a fast retrain is occurring.

SuggestedRemedy

In Figure 55-15, change the condition to enter state TX_INIT from pcs_reset to (pcs_reset + !pcs_data_mode). Note that this has a common resolution with an issue in which the transmit and receive PCS state diagrams can get out of sync.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55** *P* **201** *L* **2** # 360

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Michael Grimwood. It is possible for the PCS 64B/65B transmit state diagram to encode LP_IDLE but not transition into TX_L, resulting in the transmitter and receiver being out-of-sync. This can occur during PCS_Test when loc_lpi_en is false and the transmitter encodes tx_raw of type LI resulting in the receiver decoding rx_raw of type LI.

SuggestedRemedy

In Figure 55-15, add a transition into TX_INIT conditioned on the PHY Control state diagram not being in state PCS_Data. Eliminate all dependence on the variable loc_lpi_en. In Figure 55-16, add a transition into RX_INIT conditioned on the PHY Control state diagram not being in state PCS_Data. A presentation will be submitted showing the required changes to Figures 55-15 and 55-16.

Proposed Response *Response Status* **O**

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

55.3.5.4 The EEE transmit state diagram conflicts with the fast retrain state diagram. The fast retrain state diagram should take precedence. This can be resolved by holding the EEE transmit state diagram in state TX_NORMAL when a fast retrain is occurring.

SuggestedRemedy

Change the condition to enter state TX_NORMAL from pcs_reset to (pcs_reset + !pcs_data_mode).

Proposed Response *Response Status* **O**

Cl **55** *SC* **55** *P* **209** *L* # 369

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Paul Langner Paul.Langner@aquantia.com Currently the IEEE fast-retrain mechanism being proposed does not implement a mechanism to inform the MAC that the link is temporarily unavailable. As a result, the MAC will continue to send data during a fast-retrain (for up to 30 ms). This data will all be lost. In order to prevent this from occurring, a mechanism is needed to inform the MAC that the link is temporarily unavailable, so that the data will not be lost, and can be buffered until the link is available.

SuggestedRemedy

Create a control code (similar to Local Fault) that indicates that the link is temporarily unavailable, and this control code would be sent continuously to the MAC until the retrain is completed.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55** *P* **209** *L* **46** # 365

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Michael Grimwood. In initial training the THP is turned off at the beginning of state PMA_Coeff_Exch. During PCS_Data, the THP is on. During a fast retrain in PMA_Coeff_Exch, is the THP on or off?

SuggestedRemedy

Change: "After completing the link failure signal the PHY shall transition to the PMA_Coeff_Exch state and send PAM2 signaling within a time period equivalent to 9 LDPC frame periods ." To: "After completing the link failure signal the PHY shall transition to the PMA_Coeff_Exch state, keep its THP turned on with its previously-exchanged coefficients, and send PAM2 signaling within a time period equivalent to 9 LDPC frame periods."

Proposed Response *Response Status* **O**

Cl **55** *SC* **55** *P* **209** *L* **52** # 366

Bennett, Michael Lawrence Berkeley Na

Comment Type **T** *Comment Status* **X**

Submitted on behalf of Michael Grimwood. LPI uses a training sequence based on scramblers that are free running from PCS Reset or if scrambler re-initialization is used for initial training, from PCS_Test. In order to ensure that fast retraining is compatible with LPI, the scrambler should not be re-initialized by fast retraining events. To accomplish this, constrain fast retraining to use a training sequence without periodic re-initialization and establish that it be free running from PCS reset or from the first entry to PCS_Test if scrambler re-initialization is used for initial training. (similar to the specifications for LPI).

SuggestedRemedy

Add this paragraph after line 52: The PAM2 symbols are generated using the PMA side-stream scrambler polynomials shown in Figure 55-13. The training sequence without periodic re-initialization described in 55.3.4 shall be used during fast retraining, with the scramblers free-running from PCS Reset. If scrambler re-initialization is used for initial training, it shall be disabled and the scramblers shall begin free-running when the PHY Control state diagram enters the PCS_Test state and the variable fr_active is FALSE.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.1** *P* **182** *L* **11** # 202

Brown, Matthew Applied Micro (AMCC)

Comment Type **TR** *Comment Status* **X**

Last sentence of paragraph implies that fast retrain is available only if EEE capability is supported, whereas subsequent sub-clauses implies that support for fast retrain is independent. I believe that the intent that EEE and fast retrain support are independent. In other words, either or both may be implemented and if both are implemented then neither, either, or both may be resolved through AN.

SuggestedRemedy

Clarify which is the case: (a) fast retrain may be supported only if EEE is supported or (b) fast retrain may be supported indepedent of EEE.

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.1** *P* **182** *L* **11** # 353

loc_lpi_en does not control the PHY as intended.
loc_lpi_en was intended to inhibit transitions to the transmit low power mode if the PHY had not reached the PCS data mode (i.e. during PCS Test).
In the PCS 64B/65B state machine, Figure 55-15, the loc_lpi_en variable is used to inhibit transitions to TX_LI. However, when lpi_loc_en is asserted the tx state machine will stay in the TX_C state, which still encodes the XGMII data into the transmit signal. Therefore LPI codewords will be sent to the link partner, which will interpret them as a SLEEP command, and begin the transition into low power signaling. Since the transmit side is prevented from entering the TX_L state until PCS_data, the low power signaling will not be sent and the link will likely fail.

SuggestedRemedy

Use a different mechanism to prevent transitions to LPI during PCS_Test e.g. hold the transmitter in TX_INIT until the PCS_Data state.

Comment Type **TR** *Comment Status* **X**

The effect Clause 55 Fast Retrain on the Reconciliation Sublayer & MAC is unclear. Fast Retrain mechanism should be specified in a such a way that it does not indicate link down/link failure to the higher layers and also does not cause any data loss (that may cause packet drops). When the PHY Control State Diagram exits the PCS Data state to enter PMA_INIT_FR, it is unclear what action the PHY will take with respect to the XGMII path to the MAC. If PHY sends Local Fault up to the XGMII (i.e., if block_lock is lost, forcing the Local Fault ordered set) then the MAC will see this as a loss of link and this will be very disruptive to the System. The Fast Retrain mechanism is 'fast' enough to allow for recovery without sending alarms to higher functions. However, if the fast retrain is not signaled to the MAC, then the MAC may continue to send data that will be lost. It is also undesirable to drop 30msec of data without notification.

SuggestedRemedy

Fast Retrain mechanism should be specified in such a way that it does not cause a Local Fault (or signal link down to higher layers). The mechanism should also prevent the MAC from transmitting data during the retrain period to avoid any data loss or packet drops.

Clarify that flag is set after not during sending/receiving of signal. Also, signal is elsewhere referred to as link failure signal not fast_retrain signal.

SuggestedRemedy

Change definition of fast_retrain_flag to "Set TRUE after the PHY generates or detects a link failure signal and set FALSE otherwise."

The requirements of 70.7.1.5 ensure that the transmitter will provide a signal with sufficient amplitude to trigger the receiver signal detect function. It offers the receiver designer no guidance as to when the transmitter output will be fully compliant (amplitude, jitter, etc.).

SuggestedRemedy

Define the maximum time the transmitter is allowed, following the assertion of tx_quiet = FALSE, to obtain full compliance. This value is proposed to be 5 microseconds. The values in Table 78-4 must be updated to align with this allowance as this considered to be part of the transmitter's wake time shrinkage. Include a row in Table 70-4 for this value.

Proposed Response *Response Status* **O**

Cl **70** *SC* **70.7.1.5** *P* **227** *L* **51** # 301
Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

The transmitter is required to transmit a differential peak-to-oeak output greater than 800 mV within 500 ns following a tx_quiet being set to false. However, the output voltage during normal operation is allowed to be as low as 800 mV (per Table 70-6). It makes no sense to force the voltage at the start of wake to be greater than the minimum.

SuggestedRemedy

Moreover, the output amplitude should only only be as large as needed to trigger the receiver signal detect function. In other clauses, this is less than the minimum value during normal operation. Suggest that the value be 700 mV peak-to-peak differential.

Proposed Response *Response Status* **O**

Brown, Matthew Applied Micro (AMCC)

Comment Type **GR** *Comment Status* **X**

Throughout Clause 72 "low power mode" is used to refer to what is more technically "low power idle mode" or "LPI mode". Note that a "low power" mode is defined for all 802.3 PHYs and is invoked by setting MDIO bit 1.0.11 to 1.

SuggestedRemedy

Change all references to "low power mode" to "LPI mode".

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.1** *P* **235** *L* **19** # 129

Healey, Adam LSI Corporation

Comment Type **E** *Comment Status* **X**

It was decided that the "low power state" should be referred to as "low power idle (LPI) mode." The GMII signal is labeled "Assert LPI" and not "Assert Low Power Idle" or "Assert PMD_LPI". There is no clear definition of what "sleep symbols" are.

SuggestedRemedy

Change paragraph as follows. "A 10GBASE-KR PHY with the optional Energy Efficient Ethernet (EEE) capability may optionally enter the Low Power Idle (LPI) mode to conserve energy during periods of low link utilization. The "Assert LPI" request at the XGMII is encoded in the transmitted symbols. Detection of LPI signaling in the received symbols is indicated as "Assert LPI" at the XGMII. Upon the detection of "Assert LPI" at the XGMII, an Energy Efficient 10GBASE-KR PHY continues transmitting for a pre-defined period, then ceases transmission and deactivates transmit functions to conserve energy. The PHY periodically transmits during this quiet period to allow the remote PHY to refresh its receiver state (e.g. timing recovery, adaptive filter coefficients) and thereby track long term variation in the timing of the link or the underlying channel characteristics. If, during the quiet or refresh periods, normal inter-frame is asserted at the XGMII, the PHY re-activates transmit functions and initiates transmission. This transmission will be detected by the remote PHY, causing it to also exit the LPI mode." In addition, scrub the rest of the clause for instances of "low power mode" and replace them with "LPI mode".

EEE terminology.

SuggestedRemedy
change "EEE is implemented" to "EEE is supported".

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.4** *P* **236** *L* **27** # 137

Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

The behavior of the PMD signal detect function for the optional EEE capability is not completely defined. While the alert pattern and transmitter state are defined in 72.6.2, the electrical properties of the signal are not defined. The transmitter output properties of 72.7.1.4 should be combined with some notion of a channel in order to completely define the requirements. In addition, the signal detect activation and deactivation times are sequestered in Table 72-9. The cross-reference from Table 72-9 incorrectly points to 72.6.5 which pertains the PMD transmit disable function. There is no reference in 72.6.4 to Table 72-9. This information should be more closely associated with the definition of signal detect.

SuggestedRemedy

Change the paragraph as follows. "The value of the SIGNAL_DETECT is defined by the training state diagram shown in Figure 72--5. When the PHY supports the optional EEE capability, SIGNAL_DETECT is set to FAIL following a transition from rx_mode = DATA to rx_mode = QUIET. When rx_mode = QUIET, signal_detect shall be set to OK within 500 ns following the application of a square wave pattern with a period of 16 unit intervals and peak-to-peak differential output amplitude of TBD mV to the receiver input." A presentation will be provided with the proposed value for the square wave amplitude "TBD". Update Table 72-9 with the defined square wave amplitude and signal detect activation time, correcting the cross-reference to be 72.6.4. Remove the requirement for signal detect de-assertion time from Table 72-9 since as it is irrelevant.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.7.1.4** *P* **238** *L* **39** # 134

Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

The requirements of 72.7.1.4 ensure that the transmitter will provide a signal with sufficient amplitude to alert the receiver signal detect function. It offers the receiver designer no guidance as to when the transmitter output will be fully compliant (amplitude, jitter, etc.).

SuggestedRemedy

Define the maximum time the transmitter is allowed, following the assertion of tx_mode = ALERT, to obtain full compliance. This value is proposed to be 5 microseconds. The values in Table 78-4 must be updated to align with this allowance as this considered to be part of the transmitter's wake time shrinkage. Include a row in Table 72-6 for this value.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.7.1.4** *P* **238** *L* **39** # 133

Healey, Adam LSI Corporation

Comment Type **TR** *Comment Status* **X**

The definition of the transmitter wake signal is flawed. It specifies that the transmitter's differential peak-to-peak amplitude shall be greater than 90% of trained peak-to-peak value within 500 ns of tx_mode being set to ALERT. However, 72.6.2 specifies that the transmitter will be placed in the preset state (c(0) is maximum, c(-1) and c(+1) are zero) when tx_mode = ALERT. Referencing the amplitude of the preset waveform to the amplitude of the post-training waveform adds a degree of uncertainty with respect to what amplitude will actually be delivered to the receiver. Furthermore, a receiver will be required to accomodate the worst-case (lowest) amplitude that a link partner will deliver. In light of this, it makes sense to simply define an absolute minimum output voltage that must be acheived within 500 ns. Per Table 72-8, we know that the amplitude v2 must be within 400 to 600 mV ((zero-to-peak differential) for the preset condition. In this case 90% of the minimum value would be 360 mV. This is an equivalent yet unambiguous threshold.

SuggestedRemedy

Change the requirement as follows. "Furthermore, the transmitter's differential peak-to-peak output voltage shall be greater than 700 mV within 500 ns of tx_mode being set to ALERT." [Rounded down from 720 mV.] Include a row in Table 72-6 for this value and the transmitter partial activation time.

Comment Type **TR** *Comment Status* **X**

A hold-off of 30 microseconds seems too long. For a normal wake (not a wake from refresh) the FEC rapid block lock mechanism will receive the determinstic frames approximately 12 microseconds following the start of wake. If the rapid block lock mechanism fails to acheive lock during during the 1 microsecond transmission of deterministic frames, it will be inhibited from setting signal_ok = TRUE for an additional 17 microseconds even if it has an alternate mechanism to obtain lock during that period. During this period, received frames are simply consumed by the PHY. The purpose of the hold-off is to prohibit the FEC sublayer from setting signal_ok prior to the deterministic frames being received so that those frames are never passed to the PCS for further processing. A hold-off of 13 microseconds would appear to be sufficient. With respect to the variable arrival of deterministic frames for the wake from refresh scenario, a separate comment has been submitted to alter to the transmitter behavior to make schedule for deterministic frame transmission to be deterministic. This proposal should be considered in conjuction with the proposed changes to the LPI state diagram.

'Integer (2 octets wide)' - other integers in 78.4.2.3 Variables do not have identifier whether they are 1 or 2 bytes wide. Either specifically mark each Integer type variable in terms of length or it is assumed that all of them have the same length. At this time, it is not clear how many bits you assume an Integer to have (16, 8, or 32 or more)

What is a 'Temporary integer' ? Can't you just say 'Integer used to temporarily store the value of ...' or is it something altogether different?

'NEW_RX_VALUE' is located at the very bottom of the page and defined as 'Integer that indicates the value of Tw_sys_tx that the local system wants the remote system to support. ' - seems like a variable rather than function. Why is it part of the Functions subclause then ?

SuggestedRemedy

Either change the definition to what the 'NEW_RX_VALUE' needs to represent or move to the proper location in the draft. The current location does not seem to be correct.
