*Comment Type* **TR**     *Comment Status* **X**

The state diagram in figure 152-12 shows that after am_lock is achieved, if there are 4 !am_valid conditions in a fixed window of 4 alignment marker periods, then am_lock is set to false.  Because the window is fixed in time, it is possible that up to 6 !am_valid conditions may occur and the state machine will remain in lock (i.e. 3 !am_valid conditions in one window followed immediately by 3 more !am_valid conditions in the next window).

*SuggestedRemedy*

Suggested remedy is to make the window "sliding". That is, if there are four consecutive !am_valid conditions over any four align maker periods, then the am_lock is set to false.

*Proposed Response*     *Response Status* **W**

Apparantly the commenter has commented using Draft 0.9 with old clause numbers. The clause number and subclause fields have been corrected to 82 to import into the comment database.

The definition of 40GBASE-SR4 is "IEEE 802.3 Physical Layer specification for 40 Gb/s using 40GBASE-R encoding over four lanes of, short reach, multi mode fiber."  This implies that the fibre alone determines the reach.

*SuggestedRemedy*

Re-word as: "40GBASE-SR4: IEEE 802.3 Physical Layer specification for 40 Gb/s using 40GBASE-R encoding over four lanes of multi mode fiber with short reach. (See IEEE 802.3, Clause 86.)"

Similarly re-word 100GBASE-SR10 definition to:

"100GBASE-SR10: IEEE 802.3 Physical Layer specification for 100 Gb/s using 100GBASE-R encoding over ten lanes of multi mode fiber with short reach. (See IEEE 802.3, Clause 86.)"

There are two types of description for MMF in D1.0 such as "multi mode fiber" and "multimode fiber".  Across the entire document, "multimode fiber" was mostly used. So, to maintain consistency, it will be better to change "multi mode fiber" to "multimode fiber." The change should be done in following lines.

Clause 1, page 23, line 21: multi mode fiber->multimode fiber
Clause 1, page 23, line 42: multi mode fiber->multimode fiber
Clause 80, page 85, line 31: multi mode fiber->multimode fiber
Cluase 80, page 85, line 38: multi mode fiber->multimode fiber

Table 88-12

A comment has been submitted for Table 88-7 and 88-8 (10GBASE-LR4 transmit characteristics) to increase the max optical power by 0.5dB. The purpose of this comment for Table 88-12 is to align the 10GBASE-ER spec (40km) with the changes proposed to the 10GBASE-LR (10km) spec. This will make the 40km spec consistent with the intent of 802.3ba when it adopted it as baseline, specifically that it have interoperable overload characteristics with the 10km spec.

*SuggestedRemedy*

The following three changes are proposed for table 88-12-100GBASE-ER4 receive characteristics:

Receive power, per lane OMA (max): 4.0dBm => 4.5dBm
Average receive power, per lane (max): 4dBm => 4.5dB
Damage threshold: 5.0dBm -> 5.5dBm

The SOA overload data presented in 802.3ba during this year fully supports increasing overload by 0.5dB.

*Proposed Response*        *Response Status*  **O**

*Cl* **88**        *SC* **88.6.1**              *P* **250**          *L* **13**              *#* 84

Hirotaka , Oomori                        Sumitomo Electric

*Comment Type*  **T**        *Comment Status*  **X**

The range between Max and Min transmitter launch OMA seems to be too narrow to have good yield.
The root cause is located at the low launch OMA max and the low receive OMA sensitivity.

Several numbers in Table.88-7 and 88-8 need to be modified.
A full justification is given in the attached file Oomori_01_1108.pdf

*SuggestedRemedy*

1) Change Transmitter launch OMA max from 4.0dBm to 4.5dBm
2) Change Transmitter average launch power (max) from 4.0dBm to 4.5dBm
3) Change Reciever OMA sensitivity from -8.1dBm to -8.6dBm

Other parameters are required to change as a consequence of this.  For a full list see slide 13 of attached file Oomori_01_1108.pdf

*Comment Type*  **T**      *Comment Status*  **X**

Whilst defining the operation of the PRBS error counter for the PMA, the deficiencies of the
current 10GBASE-R function should be considered.
The self-synchronous descrambling of the PRBS31 sequence shown in Figure 49-11 is
both inaccurate and costly to implement.
1) The error count is 3x the number of received error bits only if errored bits do not appear
3 or 28 bits apart (the PRBS tap seperation). So in bursty environments the count will not
be 3x the number of errors.
2) Compliance with the Figure 49-11 requires the ability to increment a counter at 10Ghz.
Any practical implementation will have to be implemented in parallel and increment a
counter at a lower rate (create a backlog of increments and do them whilst no errors are
received).
Absolute compliance to Figure 49-11 at high bits rates is not practical.

Aggregation of these counters to 40/100G will only compound these issues

*SuggestedRemedy*

Set an accuracy limit for the error counter
eg indicate that the counter need only be bit accurate at error rates above say 1e-4, and for
burst lengths of say less than 32bits

*Proposed Response*      *Response Status*  **O**

In Table 87-13, 'DGD_max' is represented to describe the PMD (polarization mode dispersion) specification. But 'DGD_max' is not sufficient to give the PMD specification of the fiber link. Parameter of P(DGD_tot > DGD_max) is needed.(from the Method 2 of IEC 61282-3). P(DGD_tot > DGD_max) is the probability that a system DGD value, DGD_tot, exceeds DGD_max.

*SuggestedRemedy*

Parameter of P(DGD_tot > DGD_max) per each lane is needed in Table 87-13.

*Proposed Response*        *Response Status*  **O**

---

*Cl* **87**       *SC* **11**                    *P* **239**          *L* **21**          # 92
Sun Hyok, Chang                          Electronics and Teleco

*Comment Type*  **T**        *Comment Status*  **X**

In line 21, it is written that 'DGD_max is the maximum differential group delay that the system must tolerate'. It is wrong. 'DGD_max' is defined in the Method 2 of IEC 61282-3. 'DGD_max' is defined with P(DGD_tot > DGD_max), which is the probability that a system DGD value, DGD_tot, exceeds DGD_max. 'DGD_max' and 'P(DGD_tot > DGD_max)' give the DGD specification of the fiber link.

*SuggestedRemedy*

The sentence 'DGD_max is the maximum differential group delay that the system must tolerate' is needed to be replaced by ''DGD_max is defined in the Method 2 of IEC 61282-3'

*Proposed Response*        *Response Status*  **O**

*Comment Type*  **T**        *Comment Status*  **X**

In Table 88-17, 'DGD_max' is represented to describe the PMD (polarization mode dispersion) specification. But 'DGD_max' is not sufficient to give the PMD specification of the fiber link. Parameter of P(DGD_tot > DGD_max) is needed.(from the Method 2 of IEC 61282-3). P(DGD_tot > DGD_max) is the probability that a system DGD value, DGD_tot, exceeds DGD_max.

*SuggestedRemedy*

Parameter of P(DGD_tot > DGD_max) per each lane is needed in Table 88-17.

*Proposed Response*        *Response Status*  **O**

---

*Cl* **88**       *SC* **12**                    *P* **262**          *L* **20**          # 94
Sun Hyok, Chang                          Electronics and Teleco

*Comment Type*  **T**        *Comment Status*  **X**

In line 20, it is written that 'DGD_max is the maximum differential group delay that the system must tolerate'. It is wrong. 'DGD_max' is defined in the Method 2 of IEC 61282-3. 'DGD_max' is defined with P(DGD_tot > DGD_max), which is the probability that a system DGD value, DGD_tot, exceeds DGD_max. 'DGD_max' and 'P(DGD_tot > DGD_max)' give the DGD specification of the fiber link.

*SuggestedRemedy*

The sentence 'DGD_max is the maximum differential group delay that the system must tolerate' is needed to be replaced by 'DGD_max is defined in the Method 2 of IEC 61282-3'

It may require as many as 100,000 test_am instances before the AM Lock FSM will reach
2_GOOD (assuming that the location of the Alignment Marker is in the last of the 16384
possible locations checked by the PCS AM Lock State Machine).  Is this a reasonable
worst-case start-up delay?

*SuggestedRemedy*

Even though the AM_SLIP function is listed as implementation specific, indicate to the
reader that the delay caused by the PCS AM Lock State Machine may take up to 100,000
blocks before reaching am_lock.

*Proposed Response*          *Response Status*  **O**

*Cl* **82**        *SC* **1.4**                    *P* **115**        *L* **37**                # 100

*Comment Type*   **E**        *Comment Status*  **X**

82.2.10 says that the scrambler starts off with a seed loaded from the MDIO registers. This seems to contradict 82.2.6 which says that there is no initial value for the scrambler. We suspect that there is no initial value for regular operation and a defined seed for test operation.  Should the specification be more specific on this point?

*SuggestedRemedy*

Clarify the sentence in 82.2.6, "There is no requirement on the initial value for the scrambler." to "There is no requirement on the initial value for the scrambler for regular operation; test-patterns shall load an initial value from the MDIO registers."

For 100G, are we really going to run with TX_CLK and RX_CLK at 1.56GHz?  This seems like quite a frequency jump; I'm surprised no consideration was given to expanding the bus width from 4 bytes to 8 or 16.  We typically time the cores with 200 ps of margin, but 1.56G only gives us a 640ps cycle time.  I think even at 45nm this would be very tight to time.

*SuggestedRemedy*
Clarify the frequency requirements or allow for a wider MII bus definition.

*Proposed Response*        *Response Status*  **O**

Ebbers, Jonathan                        IBM

*Comment Type*   **T**        *Comment Status*  **X**

82.2.8 states that the alignment markers are inserted after 16383 66-bit blocks are transmitted.  We assume this includes interrupting a data packet and not waiting until an IPG. Since we cannot possibly write over data, is this process handled at the same time and in the same way as clock compensation (idle/OSet insert/delete) in the async crossing? How can we be sure that the MII data presented to the PCS Transmitter will have enough excess bandwidth to allow for AM insertion and clock compensation?

*SuggestedRemedy*

Provide a more explicit description of the relationship between alignment marker insertion and idle insertion/deletion.  Provide a specific minimum inter-frame size for transmitted MII data (from the MAC or RS) to allow for proper AM insertion and +/- 100 PPM clock frequency compensation.

*Cl* **82**        *SC* **Figure 13**                *P* **137**        *L*            # 106
Ebbers, Jonathan                        IBM

*Comment Type*   **T**        *Comment Status*  **X**

The definition of test_am appears to be inadequate.  As defined, test_am will be true once for every 66-bit block and TEST_AM will be entered very frequently, causing !am_valid to be the exit path from TEST_AM almost every time, causing the FSM to never reach the 2_GOOD state.

*SuggestedRemedy*

Refine test_am's definition to be less like that of test_sh.  After the first detection of a valid AM, test_am should be tied to a timer that counts down from 16383 before asserting the next test_am.

*Proposed Response*        *Response Status*  **O**

Listing of Editorial Team and Officers is incomplete.

*SuggestedRemedy*

Complete list provided below.

John D'Ambrosia
 Task Force Chair

Ilango Ganga
 Task Force Editor-in-Chief,
 Editor, Clauses 1, 4, 80, Annexes A, 4A

Mark Gustlin
 "Logic" Sub-task Force Chair
 Editor, Clauses 81& 82

Chris DiMinico
 "Cu" Sub-task Force Chair
 Editor, Clause 85

Pete Anslow
 "Optical" Sub-task Force Chair
 Editor, Clause 88

Hugh Barrass
 Editor, Clauses 30, 45, Annexes 30A, 30B

Piers Dawe
 Editor, Clause 86

Jonathan King
 Editor, Clause 87

Ryan Latchman
 Editor, Annex 83A

Arthur Marris
 Editor, Clauses 69, 73, 74, 84, Annexes 69A, 69B

Steve Trowbridge
 Editor, Clause 83

George Oulundsen
 Task Force Secretary

Frank Chang
 Task Force Web Master

*Comment Type*    **E**          *Comment Status*  **X**
choice of wording

*SuggestedRemedy*
reword
The purpose of the MII is to provide a simple and easy-to-implement logical
interconnection between the Media Access Control (MAC) sublayer and the Physical Layer
(PHY). The MII is not intended to be electrically
instantiated, rather it can logically connect layers within a device.

The MII is an optional logical interface between the Media Access Control (MAC) sublayer
and the Physical Layer (PHY).

*Proposed Response*        *Response Status*  **O**

*Cl* **82**        *SC* **82.1.4**                   *P* **115**       *L* **30**             # 132

*Comment Type*   **E**        *Comment Status*  **X**
   Overview is done in a manner that is inconsistent with other PMD clauses in 802.3ba

*SuggestedRemedy*
   Put text below and Table 86-2 in front of current "Overview" intro text.
   This clause specifies the 40GBASE-SR4 PMD and 100GBASE-SR10. In order to form a
   complete PHY, the desired PMD shall be connected to the appropriate sublayers (see
   Table 86–1) and with the management functions that are optionally
   accessible through the management interface defined in Clause 45, or equivalent.

   Renumber current Table 86-1 to 86-2.

   Label new Table 86-1 as
   Table 86–1—PHY (Physical Layer) clauses associated with the 40GBASE-SR4 and
   100GBASE-SR10 PMDs

   add row in new table 86-1 for Annex 83A-XLAUI - mark optional under 40G and "na" under
   100G
   add row in new table 86-1 for Annex 83A-CAUI - mark optional under 100G and "na" under
   40G

*Comment Type*   **T**       *Comment Status*  **X**

add "PPI" as a compatibility interface

*SuggestedRemedy*

add the following
Parallel Physical Interface (PPI).  The PPI is provided as a physical instantation of the PMD service interface for 40GBASE-SR4 and 100GBASE-SR10 PHYs.  While conformance with implementation of this interface is not strictly necessary to ensure communication, it is recommended, since it allows maximum flexibility in intermixing PHYs and DTEs.  THe PPI is optional

*Comment Type*   **T**        *Comment Status* **X**

Per the baseline proposal, trowbridge_01_0708, PMA interfaces are abstract, logical, or physical.

*SuggestedRemedy*

Change wording
Electrical and timing specifications for the XLAUI and CAUI interfaces based on 10Gb/s per lane signaling are covered in Annex 83A. The PMD service interfaces for 40GBASE-SR and 100GBASE-SR PMD are covered in 86.1.1. Other PMA interfaces are specified as logical interfaces, and may not be realized physically.

to

The interfaces for the inputs of the 40GBASE-R and 100GBASE-R PCS's are defined in an abstract manner and do not imply any particular implementation. The PMD service interfaces for 40GBASE-SR and 100GBASE-SR PMDs are defined in 86.1.1.  Other PMD service interfaces are defined logically. For 40GBASE-R PMA's, an interface, known as XLAUI, connecting PMA stages has been defined in Annex 83A.  For 100GBASE-R PMA's, an interface, known as CAUI, connecting PMA stages has been defined in Annex 83A.

Table 88-7-100GBASE-LR4 transmit characteristics
Transmit eye mask definition {X1, X2, X3, Y1, Y2, Y3} TBD
The adopted 100GBASE-LR4 baseline (cole_01_0708) also had a footnote which stated
"Tx eye mask spec to be specified as per eye mask methodology discussions." This
specifically referred to using the results of the Statistical Eye discussions, which have now
been formalized in the Statistical Eye Ad Hoc.
Since there is no final concensus recommendation from the Statistical Eye Ad Hoc, the
specification TBD can not be completed.

*SuggestedRemedy*

Replace TBD in Table 88-7 with eye mask coordinates as in Clause 52, Table 52.12. Add
Transmitter Optical Waveform measurement procedure as in Clause 52 Section 52.9.7.
Remove references to 10GBASE-L and 10GBASE-W, from second and third sentence,
respectively.

*Comment Type*   **TR**      *Comment Status*   **X**
The XLAUI/CAUI specification is such that:
a. The transmit test point is defined right at the transmitter output.
b. The channel is normative
c. The receiver test point is defined right at the receiver input.
The question is:
Whose responsibility is it to ensure that the receiver input meets the specification defined in 83A.3.4.2 "Input signal definition"?
There may be a situation where each of the components meets the spec. requirements but the system does not work, i.e.
1. The tranmitter meets the spec. requirements at its input.
2. The channel meets its specifications.
3. The receiver operates flawlessly with the input signal as defined in 83A.3.4.2.
But, since the resultant receiver input Of transmitter+channel is not a requirement, the actual input signal will be different and the system will not work.

*SuggestedRemedy*
Leave the normative channel requirements.
Change the transmit test point so that it is tested at the receiver input.
If the transmitter meets the requirements, this will ensure a minimal input signal for the receiver.
In addition, define the tranmitter spec. requirements at that point so that they match 83A.3.4.2 "Input signal definition".

*Comment Type*    **TR**        *Comment Status*  **X**

    Subclause 74.5 (which is not part of our D1.0) needs to be changed to enable it to hook up
    to our PCS and PMA sublayers.

    Here are the current primitives for the FEC clause (based on the 16 bit wide parallel bus):
    FEC (clause 74) primitives:
    a) FEC_UNITDATA.request(tx_data-group<15:0>)
    b) FEC_UNITDATA.indication(rx_data-group<15:0>)
    c) FEC_SIGNAL.indication(SIGNAL_OK)

    Right now this clause won't hook up to the PCS or PMA clause. Right now for the 40/100G
    PCS:
    PMA_UNITDATA.requestx (x = 0-3 for 40GBASE-R) PMA_UNITDATA.indicatex (x = 0-3
    for 40GBASE-R) PMA_SIGNAL.indication

    We need to add the correct primitives to the FEC clause so it hooks up to the 40/100G
    PCS/PMA.

*SuggestedRemedy*

    This could just be:
    40GBASE-R and 100GBASE-R run one instance of the FEC sublayer on each PCS lane.
    To hook up to the PCS or PMA sublayers, the following primitives are used.
    For 40GBASE-R the primitives are:
    PMA_UNITDATA.requestx (x = 0-3)
    PMA_UNITDATA.indicatex (x = 0-3)
    PMA_SIGNAL.indication

    For 100GBASE-R the primitives are:
    PMA_UNITDATA.requestx (x = 0-19)
    PMA_UNITDATA.indicatex (x = 0-3)
    PMA_SIGNAL.indication

Currently the BER target is TBD. Change this to a BER of 10-15. The PMD BER target is 10-12, but if you have two CAUI/XLAUI interfaces in series with a PMD interface, all with a BER of 10-12, you won't meet the overall goal of 10-12. In addition this is a chip to chip interface which typically requires a higher BER target. 10-15 seems to be a reasonable and achievable target.

*SuggestedRemedy*

Change: "The receiver shall operate with a BER of better than TBD in the presence of a reference input signal as
defined in 83A.3.4.2"

To:
"The receiver shall operate with a BER of better than 10^-15 in the presence of a reference input signal as
defined in 83A.3.4.2"

*Comment Type*   **TR**        *Comment Status*  **X**

Today in clause 74, subclause 74.5.3 it describes the primitive FEC_SIGNAL_indication. This states if the FEC recieve is in lock or not. This is fine for the legacy 16 bit parallel interface, but for 40/100GbE the FEC block could be across a XLAUI or CAUI interface from the PCS. It would be better if we defined the behavior for loss of FEC lock also for the case where we just have the XLAUI or CAUI i/f between the PCS and FEC block.

*SuggestedRemedy*

Define the FEC loss of lock behavior as sending the raw unsynchronized bit stream to the PCS. Without FEC lock, and without the FEC block lock restoring the 66b blocks, the recieve PCS will be down and out of lock which is what we want in this situation.

*Proposed Response*         *Response Status*  **O**

What does the "*"  in the conditional statements mean?  I suspect that this is a boolean AND?  However most people use a & or && from what i have seen.   You  might explain your conventions for the state diagrams.  I did see where the ++ operator was explained earlier in the document.  Maybe "*" was explained and I missed it.

*SuggestedRemedy*

Add a footnote for the conventions or explain the "*" and "+" where the "++" operator was explained.   It is confusing with a mulltiply and add.

Why is there a term for 1/sqrt(f) in the insertion loss formula.   The coefficient will most likely be 0.000 becuase it blows up at low frequencies.   Read and microwave transmission line book and you see that the loss approaches a constant a low frequencies.   Instead you need a constant term for the DC loss.

*SuggestedRemedy*

Insertion loss (d) <= TBD + TBD * sqrt(f) + TBD * f

*Proposed Response*      *Response Status*  **O**

Align control block type 4b with other 66B codes. The mapping of 40GbE into ODU3 will use a transcoding algorithm that is used for other purposes (e.g., mapping of FC1200 into ODU2e) and there is improved reuse if codes are aligned. This would also leave the door open to future use of the Ethernet PCS format, for example if FC in the future were to do a 40G or 100G spec. Since the sequence ordered set only has two values (LF and RF), three bytes are plenty- we don't need 7 bytes.

*SuggestedRemedy*

Block type 4b should explicitly include the "O" code as in Figure 49-7 (rather than assuming a sequence ordered set) and four control characters (always idles in this case) in the latter half of the 66B block. An alternate solution would be to have 802.3ba use control code 0x55 rather than 0x4b and simply send the ordered set which appears once on the MII twice on the PCS.

Receive process must also insert idles to compensate for removal of alignment markers. Also suggest using similar language as 48.4.2.3 for the concept of clock rate compensation.

*SuggestedRemedy*

Suggest:

"The receive process must insert idles to compensate for the removal of alignment markers. If the PCS receive process spans multiple clock domains, it may also perform clock rate compensation via the deletion of idles or sequence ordered sets or the insertion of idles."

*Proposed Response*         *Response Status*  **O**

*Cl* **82**        *SC* **82.2.17.3**            *P* **138**        *L* **10**           # 267
Healey, Adam                              LSI Corporation

*Comment Type*   **T**        *Comment Status*  **X**

Per the PCS deskew state diagram (Figure 82–14), the definition of deskew_error in 82.2.17.2 (page 130, line 51), and the use of align_status in the Receive state diagram (Figure 82–17, page 141, line 2), a spurious bit error that occurs during an alignment marker will supress the receipt of all packets until the next next group of alignment markers arrives, which could be a significant number of packets. Hysteresis should be added to Figure 82-14 to avoid this hair-trigger behavior.

*SuggestedRemedy*

Modify state diagram such that four consecutive deskew_error indications are required to set align_status = FALSE. Due to the hysteresis in PCS alignment marker lock state diagram (Figure 82–13), it seems acceptable to set align_status = TRUE based on the single alignment_valid indication.

*Proposed Response*         *Response Status*  **O**

*Cl* **82**        *SC* **82.2.17.2.2**          *P* **130**        *L* **51**           # 268

*Comment Type*    **T**        *Comment Status*  **X**

Receiver interference tolerance requirement is unclear. Annex 69A defines a test for a 10GBASE-KR receiver in isolation.

Does this requirement imply that a single 40GBASE-KR4 lane is tested in isolation? If so, should the unused lanes be terminated by the reference impedance, and what is their operational state (active or quiescent)?

If all lanes are to be tested in parallel, are parallel instances of the Annex 69A set-up required, or does a new multi-lane test apparatus need to be defined?

*SuggestedRemedy*

A supporting presentation will be provided to compare several approaches to this problem and suggest a direction.

*Proposed Response*        *Response Status*  **O**

*Cl* **85**        *SC* **85.8.4**              *P* **183**        *L* **1**              # 272
Healey, Adam                         LSI Corporation

*Comment Type*    **T**        *Comment Status*  **X**

"Receiver characteristics are summarized in Table 85–5 and as detailed in 72.7.1.1 through 72.7.2.5 with the exception of the receiver characteristics specified in 85.8.4.1, 85.8.4.2, and 85.8.4.3."

Subclause 71.7.2.1, Receiver interference tolerance, which references Annex 69A, defines a test for a 10GBASE-KR receiver in isolation.

At the same time, subclause 85.8.4.1 states that "the receiver shall operate with a BER 10^(−12) or better when receiving a compliant transmit signal, as defined in 85.8.3, through a compliant cable assembly as defined in 85.9 exhibiting the maximum insertion loss of 85.9.2."

This implies that all lanes as tested as an aggregate using a cable assembly model spanning TP2 to TP3.

Which requirement applies?

*SuggestedRemedy*

A supporting presentation will be provided to compare several approaches to this problem and suggest a direction.

Healey, Adam                         LSI Corporation

*Comment Type*    **T**        *Comment Status*  **X**

This subclause states that "the skew budget that the PCS receiver must support is shown in Table 82–4." The skew budget in Table 82-4 presumes a concatenation of optional interfaces and a generous allocation for media skew that may not be present in every compliant implementation. Consider, for example, that a 40GBASE-KR4 PHY has a need for considerably less skew tolerance. By mandating a fixed tolerance, needless latency is introduced for this PHY type. One can expect a demand for low latency interfaces in the marketplace.

Also note that the receiver skew tolerance requirements are not defined in Clause 48 which defines similar deskew functionality.

*SuggestedRemedy*

It is sufficent to define the maximum skew contributions for each component of a 40 Gb/s and 100 Gb/s link leading up to the input of the PCS receiver. These contributions may be summarized in a table (such as Clause 48, Table 48-5) so that the implementer may easily calculate the skew tolerance required for the targeted application. Remove the normative requirement for PCS skew tolerance (including Table 82-4).

*Comment Type*   **TR**        *Comment Status*   **X**

Given the target distance of 100 meters, we need to evaluate the possibility of eliminating the encircled flux specification. This will likley be a challenging specification to meet over temperature (or even at a single temperature on all lanes) for a parallel optical module. General discussions on the expected impairment in modal bandwidth for an overfilled as opposed to restricted launch into OM3 fiber suggest that eliminating encircled flux may be possible, but further analysis of this question by an ad-hoc group may be necessary.

*SuggestedRemedy*

Eliminate the encircled flux specification from Table 86-8 and any other places referenced in these clauses.

The lane wavelengths used for the 40GBASE-LR4 PMD should be the same as the wavelengths used for the Clause 53 10GBASE-LX4 PMD. This will allow maximum re-utilization of laser and optical demultiplexer technologies developed for 10GBASE-LX4. Reducing development costs have a direct impact on the economic feasibility of this project. It would be a mistake to walk away from a technology investment that has been paid for and proven over years of manufacturing. Additionally, the proposed reduction of the channel bandwidth from 13.4 nm (10GBASE-LX4) to 13 nm (40GBASE-LR4) would have some impact on laser yields and consequently cost. In order to allow a 0-70 C module operating range, the lasers need to be in spec from -5 to +85C. Assuming 0.1 nm/C, 9 nm of the band is taken by temperature. Approximately 1.5 nm is allocated for guard bands. Consequently, the window that is being targeted for laser operation at a given temperature is 2.5 nm for the proposed 40GBASE-LR4 versus 2.9 nm for 10GBASE-LX4.

*SuggestedRemedy*

Change all references for L0, L1, L2, and L3 to match the wavelength specifications in Clause 53 (10GBASE-LX4).

Dawe, Piers                                Avago Technologies

*Comment Type*   **TR**        *Comment Status*   **X**

The paragraph quoted has several problems and seems to have no purpose beyond advertisement. Any reader of a document like this will be above such material.
'The 40 and 100 Gigabit Ethernet extends the IEEE 802.3 protocol to operating speeds of 40 Gb/s and 100 Gb/s. The bit rate is faster and the bit times are shorter—both in proportion to the change in bandwidth while maintaining maximum compatibility with the installed based of IEEE 802.3 interfaces. The minimum packet transmission time has been reduced by a factor of four for 40 Gb/s and ten for 100 Gb/s.'
Extends? will be wrong when .3ba is rolled into the base standard. 'bandwidth' is wrong term. 'while maintaining maximum compatibility with the installed based of IEEE 802.3 interfaces' There is very little compatibility with the installed based of IEEE 802.3 interfaces intended (and none spelled out in the objectives). 'packet transmission time' means? For links up to 10 and 40 km, transmission time is substantially determined by the speed if light, not the MAC rate. 'factor of four' as compared with what?

*SuggestedRemedy*

Delete the paragraph. Anyone who thinks it leaves a void can bring in something better next time.

    MAC Control PAUSE can't be used with long links because the round trip latency becomes
    too much to cope with.  At each higher MAC rate, this is ever more true.  If the entity above
    the MAC wants to know the round trip latency, it should use Ping or similar method to find it
    out for a particular link.  Even with this table, for many port types there is no guarantee that
    the nominal maximum latency is not exceeded because 'A PMD which exceeds the
    operational range requirement while meeting all other optical specifications
    is considered compliant'.

*SuggestedRemedy*
    Remove the table rows for 40GBASE-LR4 PMD, 100GBASE-LR4 PMD and 100GBASE-
    ER4 PMD.  Delete 87.2.1 and 88.2.1, change '87.2 Delay and skew'  to '87.2 Skew',
    similarly 88.2.

*Proposed Response*        *Response Status*    **O**

   Decide once and for all whether to allow 'unidirectional' operation at 40 and 100G.  Per
   conversation at last meeting, it seems it's possibly helpful for an unprotected link, probably
   harmful for a protected link.  Will there be unprotected managed 40G or 100G Ethernet
   links?

*SuggestedRemedy*
   Decide and write it down.  If we do allow unidirectional, the bad Hamming distance of the
   Sequence ordered_sets might be worth changing.

*Proposed Response*       *Response Status*  **O**

*Cl* **82**      *SC* **82.1.1**                      *P* **146**         *L* **1**              # 320

   Draft says 'The terms 40GBASE-R and 100GBASE-R are used when referring generally to
   Physical Layers using the PCS defined here.'  There should be nothing rate-specific in the
   PCS clause; these are generically useful PCSs that could be re-used at faster VL rates in
   future.  The PCSs could be thought of as 'R4' and 'R20'.

*SuggestedRemedy*
   No urgent need to rename them, but it's worth adding a sentence to say that one uses 4
   PCS lanes and the other uses 20 PCS lanes, here in the Scope.

*Proposed Response*       *Response Status*  **O**

*Cl* **82**      *SC* **82.1.1**                      *P* **113**         *L* **23**             # 321
Dawe, Piers                                    Avago Technologies

*Comment Type*   **T**        *Comment Status*  **X**
   'medium be compliant at the PMA level.'  The medium is not at the PMA level, and not
   connected directly to the PMA.  Also, there could be FEC between PMA and PCS.

*SuggestedRemedy*
   Does this work: 'The 40GBASE-R and 100GBASE-R PCSs can operate with any full duplex
   medium requiring only that the sublayers below the PCS provide a compliant service
   interface to the PCS.'

*Proposed Response*       *Response Status*  **O**

*Cl* **74**      *SC* **74.7.4.5**                    *P* **79**          *L* **46**             # 322
Dawe, Piers                                    Avago Technologies

*Comment Type*   **TR**       *Comment Status*  **X**
   The moderate power taken by FEC is spent four ways: encoding (basically a CRC
   generation), error detection (CRC checking), error correction, and re-coding as non-FEC
   64B/66B and error marking.  A significant fraction of the power and complexity goes in
   error correction; all the rest is straightforward.  Most of the latency is taken by error
   correction and optional PCS error marking.  In some scenarios e.g. a copper cable
   approaching 10 m, we need FEC for its error detection.  In other scenarios e.g. 40GBASE-
   KR4, 100GBASE-ER4, we do (or should) allow FEC for its error detection as well.
   But when a particular link is up and running, a receiver that is happy with its received BER
   can switch the correction off, with no need for handshaking with the transmitter. This still
   gives excellent error detection, and remains compatible with PCS error indication.  In
   principle this could be done lane by lane but the remedy below treats all the lanes as a
   group.  There is another comment for Clause 74.

*SuggestedRemedy*
   Add sentence 'For reduced power, latency and complexity, in some circumstances the FEC
   decoder detects errors but does not attempt to correct them.  These circumstances are
   explained in the relevant PMD clauses e.g. Clause 84 to Clause 88.'
   I intend to provide a short presentation showing the difference between error detection and
   error correction.

*Comment Type*    **TR**        *Comment Status*  **X**
Tracking the last little bit of skew costs power in high speed analog circuitry.  The PCS is implemented as a silicon chip in a package on a PCB.  It has no need to generate anything remotely like 2 bits of Dynamic Skew (if 'bits' means UI).  There could be several x 10 ps gate delay, most of which is correlated lane to lane (giving maybe 5 ps Dynamic Skew) plus perhaps 2" or 400 ps mismatched lane lengths on the PCBs, which might change by 5% over temperature and humidity: that's 20 ps.  Total 25 ps (0.25 UI at 10G, 1 MAC BT for 40G, 2.5 MAC BT for 100G).

*SuggestedRemedy*
Change PCs dynamic skew output limit to 25 ps.

*Proposed Response*        *Response Status*  **O**

*Comment Type*    **TR**        *Comment Status*  **X**
The primary purpose of the nAUI spec is the same as the XFI spec at 10G: to provide a standardised and interoperable spec for plugging retimed transceiver modules into line cards or similar.  Like XFI (part of XFP), it needs to take a connector into account (does not need to define the connector mechanicals) and define the compliance points with reference to the connector.

*SuggestedRemedy*
Use the six TP compliance points defined in 86.7.1, relegate the points in Fig 83A-2 to informative reference points like A and D in SFP+.

Text says 'the supportable PMA stages' but table is not complete. For example, Tx 2:1 is missing. If you add all the missing possibilities the table might get rather long, although the rows could be shallower. I don't think we should talk about 'initial version of the standard': 802.3 is very old, and we have not yet made any promises that there will be a version which will use more of this table.

*SuggestedRemedy*

Suggest you list only the 'prime factors'. For 40G, that's 4:2, 2:1, 1:2, 2:4., 1:1, 2:2, 4:4. Say in main text, not just a table note, that PMAs such as 4:1 and 1:4 may be made without going though the intermediate (in this case 2-wide) stage (and if such is true, they could map the lanes a bit differently to how a tree of atomic PMAs would).

*Proposed Response*      *Response Status* **O**

*Comment Type* **T**        *Comment Status* **X**
Lane mapping in loopback: as fibre-optic PMDs can't do loopback, one wants the PMA loopback to occur near the bottom of any tree of PMAs (e.g. this from 48.3.3 'NOTE—The signal path that is exercised in the Loopback mode is implementation specific, but it is recommended that this signal path encompass as much of the circuitry as is practical.'  A 2^n-1 PRBS spread across 4 lanes is four 2^n-1 PRBSs, so I think we can still validate working silicon if the lanes get mixed up.  Although if the silicon is faulty, it may be harder to know which lane is at fault.

*SuggestedRemedy*
Expect and allow the lanes to be repositioned in loopback.

I understand that 10 m is extremely challenging.  A link like this if it fails will create error bursts not just single errors, endangering mean time to false packet acceptance.

*SuggestedRemedy*

Do investigations to quantify the level of difficulty.  First, can a reasonable 10 m cable with reasonable lengths of PCB traces give a channel within the high confidence region as defined for 10GBASE-KR in 802.3ap Annex 69B?   Second, is that an adequate or complete condition for as low-BER link?
Define a length and cable electrical spec above which FEC is mandatory, and/or reduce the distance objective for Clause 85.

*Proposed Response*     *Response Status*  **O**

*Cl* **85**    *SC* **85.9**                  *P* **184**        *L* **2**          # 343

*Comment Type*  **TR**    *Comment Status*  **X**

It is very good that TP1, TP2 TP3 TP4 are positioned in relation to the connector, but not clear enough where they are exactly with respect to the connector.  While for some measurements like S-parameter measurements on a passive cable, de-embedding can be used to infer the performance right next to the connector, For measurements of nonlinear active elements like transmitters and receivers, in general this cannot be done.

*SuggestedRemedy*

Use the same defined reference losses between each TP and the connector as in Clause 86: this includes specifying the loss between PMD and TP2 in 85.8.3.1 Fig 85-3.  For the S-parameter specs, where de-embedding is viable, give the equivalent de-embedded specs also so that the cables can be assessed using either approach.

Have we allowed enough for connector loss?

*SuggestedRemedy*
Check that we have allowed enough for 100 m of fibre and a reasonable number of
connectors, remembering that with a restricted launch, the actual connector loss is less
than the measured connector loss.  Reduce the numbers in the minimum column by 0.1 dB
if appropriate, and adjust Table 86-13, fill in TBDs in 86.10.2.2.1.  Remove the footnote
here.

*Comment Type* **TR**          *Comment Status* **X**
The device address structure of Clause 45 dates from XENPAK days.  As the PMD and
PMA may now be separate, they cannot always be managed as a single MMD unless a
proxy is used.  Even then, one loses the ability to control each one independent of the
other with the present allocation of MMDs to registers.  Also, there can be multiple
separate PMAs for any port, with multiple possible loopback positions for example.

*SuggestedRemedy*
Continue to manage the PMD with device address 1, but allocate a device address number
(the next available is 8) to PMA.  Use a register within address 8 as an addressing scheme
to distinguish between multiple PMDs of the same port.  Copy the old stuff relevant to
40G/100G PMAs from 1 to 8, put the new stuff in 8.  I believe a nAUI interface can count
as a n:n PMA, but there could be two sorts like the 'PHY XS and DTE XS' in 10G.

Dawe, Piers                              Avago Technologies

*Comment Type* **TR**          *Comment Status* **X**
The copper-cable receivers are expected to rely even more on long DFE than Backplane
Ethernet, and so when errors happen, moderately long error bursts are very probable.  This
overwhelms the CRC's error-detecting guarantee.  These port types do not go into closed
systems as Backplane Ethernet ports do, so the standard has to take responsibility for
avoiding false packet acceptance rather than the system implementer.

*SuggestedRemedy*
FEC encoding and error detection must be mandatory, to provide adequate error
detection.  This is significantly less onerous than requiring mandatory full FEC error
correction (correcting errors is a step beyond detecting them) which can remain optional.

*Comment Type*    **TR**       *Comment Status*  **X**
84.8 refers to 72.7, which says '...the PMD sublayer is standardized at test points TP1 and
TP4 as shown in Figure 72-1.  The electrical path from the transmitter block to TP1, and
from TP4 to the receiver block, will affect link performance and the measured values of
electrical parameters used to verify conformance to this standard.  Therefore, it is
recommended that this path be carefully designed.'  In other words, there is no expectation
that a board from vendor A, a backplane from B and another board from C can be
expected to interoperate reliably, because each of them can spend as much of the shared
channel budget as he pleases.  This is not an interoperability spec, it's just an
advertisement for some ICs.  Is this what we want?

*SuggestedRemedy*
Discuss.  Options are: make it into a proper interoperability spec with test points related to
the connectors (Clause 86 will have to do much of that work anyway), delete the clause,
move it to an annex, or accept that it's not a proper spec.

*Comment Type*  **TR**      *Comment Status*  **X**

The moderate power taken by FEC is spent four ways: encoding (basically a CRC generation), error detection (CRC checking), error correction, and re-coding as non-FEC 64B/66B and error marking. A significant fraction of the power and complexity goes in error correction; all the rest is straightforward. Most of the latency is taken by error correction and optional PCS error marking. In some scenarios e.g. a copper cable approaching 10 m, we need FEC for its excellent error detection capability. In other scenarios e.g. 40GBASE-KR4, 100GBASE-ER4, we do (or should) allow FEC for its error detection as well.

But when a particular link is up and running, a receiver that is happy with its received BER can switch the correction off, with no need for handshaking with the transmitter. This still gives excellent error detection, and remains compatible with PCS error indication. In principle this could be done lane by lane but the remedy below treats all the lanes as a group. There is another comment for Clause 74, and a short presentation.

*SuggestedRemedy*

Add another register bit in Table 45-61,
1.170.2
xxx FEC error correction disable ability
A read of 1 in this bit indicates that the xxx FEC sublayer is able to operate while detecting but not correcting received errors.
RO
Insert new 45.2.1.84.1 xxx FEC error correction disable ability (1.170.2)
When read as a one, bit 1.170.2 indicates that the xxx FEC decoder is able to operate while detecting but not correcting received errors (see 74.7.4.5). When read as a zero, the xxx FEC decoder is not able to operate while detecting but not correcting received errors.
Add another register bit in Table 45-62,
1.171.2
FEC error correction disable
A write of 1 to this bit configures the xxx FEC decoder to operate while detecting but not correcting received errors.
R/W
Insert new 45.2.1.85.1 10 Gb/s FEC error correction disable (1.171.2)
This bit instructs the xxx FEC decoder to operate while detecting but not correcting received errors (see 74.7.4.5)
When bit 1.171.2 written as a one, if 1.171.1 is one, the xxx FEC decoder shall operate while detecting but not correcting received errors (see 74.7.4.5). When bit 1.171.2 is written as a zero, the xxx FEC decoder shall either correct as well as detect received errors according to 74.7.4.5, or neither detect nor correct, as determined by bits 1.170.0 and 1.171.0.
The default value of bit 1.171.2 is zero.

*Comment Type*    **TR**        *Comment Status*  **X**

In Table 86-8, the characteristics, Optical Modulation Amplitude (OMA), Optical Modulation Amplitude(OMA), Aggregate signal parameter, and RIN12OMA can be replaced by using the Transmitter eye mask as the aggregate signal parameter.

*SuggestedRemedy*

In Table 86-8, delete or label as informative the characteristics, Optical Modulation Amplitude (OMA), Aggregate signal parameter, and RIN12OMA and use the Transmitter eye mask as the aggregate signal parameter.

*Proposed Response*      *Response Status*  **O**

*Cl* **86**        *SC* **86.6.2**                    *P* **209**        *L* **36**            # 406
Petrilla, John                                  Avago Technologies

*Comment Type*    **TR**        *Comment Status*  **X**

In Table 86-8, the entry for Transmitter eye mask definition calls for X3, Y2 and Y3 coordinates which are not required, does not label the coordinates as Specification values and has TBD as entries in the Type and Value columns and no entry in the Unit column.

*SuggestedRemedy*

In Table 86-8, add a header row to label the Transmitter eye mask coordinates as Specification values (See Tables 86-6 & 7 as examples.), delete X3, Y2 and Y3 coordinates, split the remaining coordinates into two rows, one for X1 & X2 and the other for Y1 (againing using Tables 86-6 & 7 as examples), replace the TBD and enter 0.225 as the value for X1, 0.355 as the value for X2 and 176 as the value for Y1, enter UI as units for X1 & X2 and uW as units for Y1 and add a reference to subclause 86.7.4.7.  Since there is no applicable figure in subclauses 86.6.2 or 86.7.4.7 (nor 83A.3.3.5) for Tx eye masks where Y1 is an absolute value, create a new figure and insert in subclause 86.6.2, 86.7.4.7 or where otherwise appropriate.

*Comment Type*    **T**        *Comment Status*  **X**

The use of "Backplane/Copper/TBD" is particularly ugly. The TF needs to settle on a vergage and stick to it. It doesn't need to be perfect - exceptions and usage changes can always be noted where required.

All of the usage in 802.3ba is BASE-R copper so that usage seems to be the most obvious. There may be some small exceptions for non BASE-R backplane (I haven't checked all the details) but these can be covered with specific notes. Future BASE-R copper may not use the same registers, but that bridge can be crossed when (if) we reach it.

*SuggestedRemedy*

Change "Backplane/Copper/TBD" to "BASE-R copper"

Table 45-3 and all related 45.2.1 register definitions.

The footnote below Table 45-3 can be retained (with the name change). The verbage at the beginning of each register definition should mimic the footnote.

Remove the editor's note.

*Proposed Response*        *Response Status*  **O**

*Comment Type*    **T**        *Comment Status*  **X**
This clause reproduces most of Clause 49 without any reference to that clause. There are a number of reasons why this is a bad idea.

Firstly, it allows the definition of the 64B/66B PCS to diverge more than necessary for the development of 40 & 100G. This may cause problems, especially with developers who are planning to reuse parts of their 10GBASE-R designs for 40G or 100G. Subtle differences between the clauses will not easily be noticed.  This may be particularly difficult for developers of multi-rate implementations (e.g. 4 x 10G that also supports 40G - or other combination silicon development).

It also wastes time reviewing and commenting on pages of specification that are already in the standard. Not to mention that LOAs may have to be resubmitted for IP that is already in Clause 49.

*SuggestedRemedy*
Rewrite the clause so that copied text is referenced and only the changes and additions are included in this clause.

The commenter will supply complete text if required (based on the existing Clauses 49 and 82).

Add cable assembly ICR specification to limit the total multi-disturber cable assembly crosstalk noise. Add TBD to equation as contributions from IL and power sum crosstalk to ICR under consideration.

*SuggestedRemedy*

Add new subclause below 85.9.x Cable assembly power sum differential crosstalk
 >>85.9.x Cable assembly insertion loss to crosstalk ratio (ICR)

The cable assembly insertion loss to crosstalk ratio (ICR) is the ratio of the cable assembly insertion loss to the total cable assembly crosstalk loss determined using Equation (89.xx).

$ICR(f) = -IL(f) + PSXT(f)$ (TBD) dB

100MHz</=f</=5156.25 MHz

Add text: Assuming ICR is computed at N uniformly-spaced frequencies fn spanning the frequency range 100 MHz to 5156.25 MHz,
ICRfit may be computed using Equations (85-x) through (85-x); utilize Equations (69B–19) through (69B–23.

Add text: ICRfit shall be greater than or equal to ICRmin as defined by the following equation:Add TBD to equation as contributions from IL and power sum crosstalk to ICR under consideration.

Add equation: $ICRfit(f)>/=ICRmin(f)=23.3-18.7*LOG((f*10^6)/(5*10^9))-2.5$ (TBD) dB

Add Figure to illustrate insertion loss to crosstalk ratio limit.

Note: 2.5 dB of the 3 dB signal-to-noise ratio penalty related to insertion loss deviation embodied in 802.3ap ICRmin is applied as 2.5 dB ICRmin margin to account for reduction in ILD penalty for CR4 and CR10

*Comment Type*    **TR**        *Comment Status*  **X**

Add cable assembly ILD specifications to limit cable assembly ILD.Add TBD to equation as contributions from IL and power sum crosstalk to ICR under consideration.

*SuggestedRemedy*

Add subclause page 185 line 50 85.9.x Cable assembly insertion loss deviation
Insert text under subclause
The cable assembly insertion loss deviation is the difference between the cable insertion loss and the fitted insertion loss determined using Equation (85-x).

$ILD(f) = IL(f) − ILfitted(f)$ (85-x)

The fitted insertion loss is determined using Equations (85.xx)-(85.xx); use 69B-1 to 69B-5 for (85.xx)-(85.xx)replacing A(f) with ILfitted(f). Add TBDs beside equations to indicate that an alternate to the least mean square line fit to the cable assembly IL is under consideration.

The ILD shall be within the region bounded by the following equations:

$ILDmax = 0.7(TBD)+0.2(TBD)*10^{−9}*(f*10^6)$ TBD  dB
$ILDmin = -0.7(TBD)+0.2(TBD)*10^{−9}*(f*10^6)$ TBD dB

1000 MHz</=f</= 6000 MHz

*Proposed Response*        *Response Status*  **O**

*Cl* **85**        *SC* **85.9.2**        *P* **185**        *L* **14**              # 458
DiMinico, Christopher                    MC Communications

*Comment Type*    **TR**        *Comment Status*  **X**

Provide values for TBDs in cable assembly insertion loss (85-1) for sqrt(f) and f. Remove 1/sqrt(f) term. Add TBD cable assembly insertion loss equation as contributions from IL and power sum crosstalk to ICR are still under consideration.

*SuggestedRemedy*

Replace TBDs with values in (85-1) Add TBD to equation as contributions from IL and power sum crosstalk to ICR under consideration.

Insertion Loss (f) = 0.192749*sqrt(f)+0.001494*f TBD dB

Remove 1/sqrt(f) term. Given the CR4 and CR10 bandwidth compared to CX4  the 1/sqrt(f) loss function term is not necessary as a regression term.

Chalupsky, David					Intel Corp.

*Comment Type* **T**			*Comment Status* **X**

There is unnecessary distinnction between CR4 and KR4 in autonegotiation.
In Table 45-3 (PMA/PMD registers) we have already set the precedent that backplane and copper registers should be kept common as much as feasible.
We should continue this practice.
Propose combining KR4 and CR4 Technology Ability fields, priority resolution, and state variables as indicated in Remedy.
Beyond simplicity there is a problem with advertising CR4 & KR4 in separate bits and allowing them both to be set.  In this case the the underlying PHY cannot distinguish if the media is backplane or copper.  The Priority Resolution Table says to pick CR4, but the meida may actually be a bakplane, so  the result would be to indicate a CR4 reslution when it is actually KR4... and it doesn't matter.  Combine the bits.

*SuggestedRemedy*

Table 73-1: Rename bit A3 "40GBASE-KR4/CR4"   Reclaim the remaining bits by naming A4 as CR10 & returning A5 to reserved.

Table 73-2: Combine CR4 and KR4 into the same resolution priority level.

subclause 73.10.1: 40GKR4 and 40GCR4 into the same variable.  Either pick one of the two existing varable names, or make a combined name like "40GCKR4".  Change the description to "represents that the 40GBASE-KR4 or 40GBASE-CR4 PMA is the signal source"

subclause 73.10.1: definition of single_link_ready: combine CR4 & KR4 (5 & 6) into one line: "5) link_status_[40GCKR4] = OK" as appropriate for the variable name used ablve.

Table 45-142 (and subclause 45.2.7.12.2): combine autoneg resolution for CR4 and KR4 into the same bit, since autoneg cannot distiguish.  Suggest using bit 5.  Change the bit 5 description to read "...is negotiated to perform 40GBASE-KR4 or 40GBASE-CR4"   (The name for this bit can be resolved in the future to be consistent with the "Backplane/Copper/TBD" names that need to be resolved elsewhere in the draft.)

*Comment Type*    **T**            *Comment Status*  **X**

Unecessary distinction between CX4 and KX4 in autonegotiation variables.
Subclause 74.7.4.1 line 17-18 already indicate sthat CX4 may be parallel detected, and
that it is up to the system implementer to distiguish KX4 form CX4 as the PHY cannot.
To be consistent with that we should remove CX4 state variables from autoneg, because
the PHY cannot distiguish parallel detected KX4 from CX4.

*SuggestedRemedy*

73.7.4.1, line 17.  After sentence "Additionally, parallel detection may be used for
10GBASE-CX4" insert "Parallel detection of 10GBASE-CX4 should be indicated by setting
the Negotiated Port Type to 10GBASE-KX4 in the management register 7.48.2."

subclause 73.10.1, page 76 line 8: delete the variable definition 10GCX4.
Page 76, line 37: delete line with "link_status_[10GCX4]=OK"

*Comment Type*   **T**        *Comment Status*  **X**

Optical receivers are in general limited by the peak power of the input signal (Average power is less important).   As the spec stands the receiver has to cope with the maximum input average power at infinite extinction ratio with the allowed eye mask overshoot.   This is much more than is likely to happen in practice.   We should limit the peak power explicitly.

*SuggestedRemedy*

Add extra rows to Tables 86-8, 86-9, 86-10.

Peak Power Max 3dBm.  (no min)

To this row in table 86-8 add a footnote.   Peak Power is the maximum value of the power as measured on the eye diagram see 86.7.4.7

*Proposed Response*       *Response Status*  **O**

Dudek, Mike                                JDSU

*Comment Type*   **T**        *Comment Status*  **X**

It is good to be explicit at what test point the specifications apply

*SuggestedRemedy*

Add at TP4a to the title of Table 86-12

*Proposed Response*       *Response Status*  **O**

*Cl* **86**        *SC* **86.6.5**              *P* **211**        *L* **50**          # 480
Dudek, Mike                                JDSU

*Comment Type*   **TR**        *Comment Status*  **X**

In order to ensure that reflections don't overally degrade performance, the differential return loss of the host needs to be specified.   To control EMI the differential to common mode reflection coefficient of the host also needs to be specified.

*SuggestedRemedy*

Add rows to Table 86-12 after Deterministic jitter tolerane

"Differential input reflection coefficient, SDD11 Max see 86.6.5.1
Reflected Differential to common mode conversion, SCD11 Max -10dB  10MHz - 11.1GHz

Change title and text of 86.6.5.1 to say "SDD22 at TP4 and SDD11 at TP4a"  (ie 2 places)

*Proposed Response*       *Response Status*  **O**

*Cl* **86**        *SC* **86.7.2**              *P* **214**        *L* **34**          # 481
Dudek, Mike                                JDSU

*Comment Type*   **T**        *Comment Status*  **X**

For consistency and to ensure reproducible measurements the square test pattern with a fixed number of ones and zeros should be used for the measurements of OMA, and RIN.

The budgeting for the link assumes that the difference between the OMA for the Tx and the OMA for the Rx is the optical loss (average power).   If the prbs9 is used to measure OMA for the Tx while square wave is used for the Rx this may no longer be true as the prbs9 pattern and square wave pattern will not always give the same answer.   (If a vendor wishes to use prbs9 for production test the vendor should guard band his measurements for the differences the guard band being based on his own product characteristics.)

*SuggestedRemedy*

Make the measurements of OMA and RIN patterns Square eight ones and eight zeros for all three rows in standard font.   Remove the editor preference note.  Change the footnote to say "The items in italics"  instead of "The second column"

*Comment Type*  **TR**        *Comment Status*  **X**

Optical receivers are in general limited by the peak power of the input signal (Average power is less important).   As the spec stands the receiver has to cope with the maximum input average power at infinite extinction ratio with the allowed eye mask overshoot.   This is much more than is likely to happen in practice.   We should limit the peak power explicitly.   (The suggested value equates to the Maximum average power at 9dB ER without overshoot).

*SuggestedRemedy*

Add extra rows to Tables 87-7, and 87-8,

Peak Power Max 4.5dBm.  (no min)

To this row in table 87-7 add a footnote.   Peak Power is the maximum value of the power as measured on the eye diagram see 86.7.4.7

*Comment Type*    **T**        *Comment Status*  **X**

Optical receivers are in general limited by the peak power of the input signal (Average power or OMA is less important).   As the spec stands the receiver has to cope with the maximum input average power with the maximum OMA and the allowed eye mask overshoot.   This is much more than is likely to happen in practice and is also restricting the maximum OMA at lower average powers.   We should limit the peak power explicitly, and relax the maximum OMA value.  (The suggested value equates to a maximum OMA of 4.5dBm with a maximum Average power of 4.5dBM, or an ER of 4.7 at 4.5dBm average power).

*SuggestedRemedy*

Add an additional row in tables 88-7,88-8, with

Peak Power Max 6.3dBm.  (no min)
Increase the Maximum OMA to 5.5dBm.

To the peak power row in table 87-7 add a footnote.   Peak Power is the maximum value of the power as measured on the eye diagram see 88.8.8

*Comment Type*    **TR**        *Comment Status*  **X**

The MPO connector is the form of choice on cabling infrastructure supporting array connectivity.  It is also the connector selected in MSAs like the QSFP and SNAP12.  Unlike past standardization periods where two-fiber connector forms were hotly debated, the MPO is virtually uncontested in the array connectivity space.  This permits straight forward specification of the MPO to terminate the cabling at the MDI.  Note that the proposed interface type 7-4 permits from 2 to 24 fibers.  It is expected that this may be further defined to be fiber-count specific.  This specificity is already possibel in the cans of 40GBASE-SR4 as the 12 fiber type.  It may be either 12 or 24 fibers as the MSA for 100GBASE-SR10 is defined.

*SuggestedRemedy*

Add the following:
The connector type terminating the cabling at the MDI shall meet the specifications of IEC 61754-7 interface 7-4 (MPO female plug connector with flat interface).

*Comment Type*   **T**        *Comment Status*   **X**

The maximum skew and dynamic skew for the multimode fiber medium are TBDs that require values. The values suggested are calculated using the skew model adopted by the TF in May 2008 found in kolesar_02_0508.xls with the default worst-case parameters at a link length of 300 m to allow for the possibility of extended reach technologies. Engineering the de-skew circuits to handle this amount of skew will permit support for possible future enhancements. Note that the skew value suggested here three times larger than that suggested in another comment submitted against line 46 of page 218 (table 86-17) wherein the channel distance is explicitly defined as a 100 m maximum.

*SuggestedRemedy*

Replace the existing sentence with:
The delays through the medium shall match to within 13.6 ns and do not change by more than 20.3 ns including the effects of varying launch conditions and operating wavelength.

*Proposed Response*       *Response Status*   **O**

Kolesar, Paul                        CommScope

*Comment Type*   **TR**        *Comment Status*   **X**

The present specification references a fiber specification as if it were a cabling specification. This can be remedied by referencing the cabling specifications for ribbon and multifiber cable forms, and also stating that the fiber contained within these cable shall meet the OM3 fiber performance code. The presently referenced cable specs are inappropriate, as the first is for simplex and duplex indoor cable, and the second for premises outdoor cable.

*SuggestedRemedy*

Replace:
The 40GBASE–SR4 and 100GBASE–SR10 fiber optic cabling shall meet the requirements of IEC 60793-2-10 and the requirements given in Table 86–18, where they differ. Multimode cables chosen from [Editor's note (to be removed prior to publication) - Insert additional reference for multiway cable if appropriate], IEC 60794-2-11 or IEC 60794-3-12 may be suitable.
With:
The 40GBASE–SR4 and 100GBASE–SR10 fiber optic cabling shall meet the requirements of IEC 60794-2-21 or IEC 60794-2-31. The fiber contained within these cables shall meet the requirements of IEC 60793-2-10 type A1a.2.

*Proposed Response*       *Response Status*   **O**

*Cl* **86**     *SC* **86.10.2.1**          *P* **210**     *L* **29**          # 520
Kolesar, Paul                        CommScope

*Comment Type*   **TR**        *Comment Status*   **X**

The dispersion characteristics quoted have been superseded. The third edition of IEC 60793-2-10 published in 2006 adjusted the characteristics to more closly reflect that actual dispersion characteristics of 50um fibers. Requiring the fiber to meet IEC 60793-2-10 makes repeating the dispersion characteristic in table 86-18 redundant. But if these specs must be repeated, then they should be in harmony with the IEC spec.

*SuggestedRemedy*

Replace the zero dispersion wavelength value with:
1295 < lambda0 < 1340

Replace the dispersion slope value with:
< 0.105 for 1295 nm < lambd0 < 1310
< 0.000375(1590 - lambda0) for 1310 nm < lambda0 < 1340 nm

Note: All the above < symbols should be "less than or equal to" symbols.

People sometimes assume that designing in a large skew buffer will add latency.    It would be good to add some clarifying text.

*SuggestedRemedy*

Add something like:

A design that allows for a large amount of skew tolerance does not add any additional latency.  Latency due to skew only occurs due to the differential delay between all paths between the source and destination.  The path with the largest latency will end up with the smallest skew buffer.

*Comment Type* **E**        *Comment Status* **X**

I find the usage of m, n, p, q, and x, y to be inconsistent throughout the text.

p and q seem to always be the the number of links on the RS/FEC facing and PMD sides of a given PMA.

x and y are introduced here "A Tx PMA with x input lanes and y output lanes is paired with an Rx PMA with y input
lanes and x output lanes" but then in 83.3.1 and 83.3.2, x is always used as the input lane count and y as the output lane count - this is direction independent.

Then in figure 83-4 and in the text that deals with bits assigned to virtual lanes (e.g. 83.6.2), m and n are used for the input and output lane count and "x" is used for the offset of the current bit.

*SuggestedRemedy*

Make the variable usage more consistent.  One way would be to have the generic input and output lane counts be "m" and "n" and the direction-specific counts as "p" and "q".  x and y can then be reserved for talking about bit positions or any other need for a generic variable.

*Comment Type*    **T**        *Comment Status*  **X**

Figure 82-13 - The state diagram is confusing (at least to me) about whether it is intending to declare alignment lock after 2 or 4 alignment blocks.  The state diagram has a back arc from VALID_AM to TEST_AM if am_cnt < 4, but if am_cnt is two, then it exits to the 2_GOOD state and we declare that we have alignment lock for that lane.

There does not seem to be any text description of the process, so I can't double-check the intent that way.

*SuggestedRemedy*

If the state diagram is in error (should be am_cnt==4 to get lock), then fix it.  Otherwise, add some descriptive text to 82.2.12 to describe the general algorithm.  Actually, adding descriptive text in either case would be good.

The classical DJ and RJ measured jitter are jitter PDF dependent and not valid for jitter distribution which are not dual-dirac.

*SuggestedRemedy*
To limit the uncorrelated jitter add UJ of 0.025 UI (RMS) per IEEE CL 68.6.8 method
Replace DJ with DDJ of 0.17 UI per method of FC-PI4 A.1.3.1 with PSBS 9 pattern

*Proposed Response*          *Response Status*  **O**

It is not clear how the HOST NEXT is accounted for in current draft and there is nothing that prevents the host having excessive NEXT.  If the amount of NEXT and FEXT for the host is equal to the test board the cable are tested with then the curent methodology hold. I can see case there will be double counting of NEXT and FEXT in the case of a low noise host but in the cases of noisy noisy host NEXT and FEXT can be under-estimated under estimated.

*SuggestedRemedy*

To eliminated the case of noisy host, the host NEXT and FEXT must also meet 85-4, 85-5, and 85-6 equations.

*Proposed Response*        *Response Status*  **O**

*Comment Type*    **TR**        *Comment Status*  **X**
KR can not operate over 10 m of 24 AWG cable which is the largest pratical size with max host PCB loss.  KR standard was devloped 3 years ago and with improved process and technology we should not limit the application to shorter than 10m or have unreasonable PCB trace loss.

*SuggestedRemedy*
Assuming PMA IC loss to TP1a and TP4a to PMA IC loss are Nyquist is 4.5 dB then based on diminico results the KR refrence channel loss at Nyquist need to be increasaed to 27 dB.  This will allow 4" of FR4-6 on each end or about 6" of improved FR4.

*Proposed Response*          *Response Status*  **O**

*Comment Type*    **TR**        *Comment Status*  **X**

Total jitter at TP4 is 0.7 UI which is the same as SFP+ single channel.  The SR4/SR10 optics are more relax than SR optics but the SerDes tolerance is the same.

*SuggestedRemedy*

The Total Jitter at TP4 for SR4 and SR10 should be 0.65 UI.  Since CR4/CR10 TJ are 0.28 UI if the optical link does not close then TJ in table 86-6 and 86-7 are suggested to be reduced to 0.28 UI

*Proposed Response*        *Response Status*  **O**

*Comment Type*    **T**         *Comment Status*  **X**

The first sentence of this clause is

The PMA Service Interface exists between the PMA client (the PCS or FEC sub-layer) and the uppermost PMA in a set of one or more stacked PMAs (possibly including an extender sub-layer).

An extender sub-layer was not been defined by the baseline, though the XLAUI / CAUI can be perceived in this fashion.

*SuggestedRemedy*

Suggested rewording -

The PMA Service Interface exists between the PMA client (the PCS or FEC sub-layer) and the uppermost PMA in a set of one or more stacked PMAs, as well as between stages in a stacked PMA.

Presentation to be provided

Service interface specification method and notation:

For all the service interfaces used in 802.3ba follow the defintion used in 1.2.2 and be consistent with service interfaces used in the base specification (IEEE 802.3-2008)

This comment applies to Clause 82 to Clause 88

In the base specification the only the parameters used in the primitive is a vector, none of the primitives are vectors.  Whereas in 802.3ba the primitive is defined as a vector with just a single parameter. This is inconsistent with the base standard (IEEE Std 802.3-2008)

Change the service interface definition in 802.3ba to be consistent with the base standard

For example the PMD service interface in Clause 86 is defined as follows:
PMD_UNITDATA.request<n:0>(tx_biti), i=0..n
or in otherwords
PMD_UNITDATA.request0(tx_bit0)
PMD_UNITDATA.request1(tx_bit1)
...
PMD_UNITDATA.requestn(tx_bitn)

Instead define the primitives with parameter as vectors as in 802.3-2008
PMD_UNITDATA.request(tx_bit<n:0>)
or in otherwords
PMD_UNITDATA.request(tx_bitn, .. tx_bit2, tx_bit1, tx_bit0)

*SuggestedRemedy*

Change service interface definition in 802.3ba to be consistent with the base specification (IEEE Std 802.3-2008). Make this change globally to Clauses 80 through 88 and remove the editorial notes.

For example the PMD_UNIDATA.request primitive in PMD service interface will be redefined as follows:
PMD_UNITDATA.request(tx_bit<n:0>)
or in otherwords
PMD_UNITDATA.request(tx_bit<n>, .. tx_bit2, tx_bit1, tx_bit0)

What is the inherent reason to use ER of 4dB, which seems ovioulsy odd?

*SuggestedRemedy*

suggest to change ER as 3.5dB or 6dB which look more realistic. (need to re-calculate the launch power numbers accordingly).

Also RIN to be -132dB/Hz is tough, suggest -128dB/Hz.

*Proposed Response*        *Response Status*  **O**

As per the 83.6.6 the "uppermost" PMA in the stack provides loopback function. It is ambiguous which one is the "uppermost", on the linkside or the host side?

Also in a stacked PMA where the PMA's are separated, loop back is desirable in both places in the stack.  E.g MAC/PCS/PMA implemented in a separate chip and PMA/PMD or PMA/FEC/PMA/PMD in a separate chip.

*SuggestedRemedy*
Clarify the term "uppermost" PMA in 83.6.6.

*Proposed Response*      *Response Status*  **O**

Ganga, Ilango                        Intel

*Comment Type*     **TR**        *Comment Status*  **X**
A PMA is always bidirectional and contains both Transmit and Receive functions. So calling this as a separate RX PMA and a TX PMA is confusing and this is not consistent through out the clause. In some references in this clause the PMA implies both for e.g 20:10 PMA which includes both TX PMA and RX PMA.

So instead of referring this as RX and TX PMA, simply define the PMA as a single block which includes both Transmit and Receive functions. This medthodology is consistent with the definitions of PCS/PMA/PMD which are all bidirectional with TX and RX functions.

*SuggestedRemedy*
Define the PMA as a single block which includes both Transmit and Receive functions, illustrated in Fig 83-3 as single PMA block with TX and RX blocks inside the PMA.  The TX function in the PMA connects to p input lanes and q output lanes. The RX function in the PMA connects to q input lanes and p output lanes. In this case the link status is associated with the RX function.

Also Change Fig 83-4 to illustrate both TX and RX functions

Also for primitives, the TX function can use PMA_UNIDATA.request and the RX function use PMA_UNIDATA.indication in the following manner

Transmit direction for data flowing from MAC to MDI
PMA_UNIDATA.request_in
PMA_UNIDATA.request_out

Receive direction
PMA_UNIDATA.indication_in
PMA_UNIDATA.indication_out

Signal indication
PMA_SIGNAL.indication_in
PMA_SIGNAL.indication_out

So this can be consistently mapped to the request and indication of PMD primitives or FEC primitives

Accordingly, update the text description and primitive definitions in 83.3

Do we need to specify  what BER the Receiver sensitivity (OMA) paramter is specified for ? I am assuming that it is BER=10-12 (same as stressed receiver sensitivity ) ?

We also need to clarify is this is the raw BER on the line or whether it is the effective BER after the error multiplication of the scrambler is taken into consideration (in which case the BER on the line is a factor of 3 less than specified). If it is indeed the former then we need to specify a way that it can be tested as this was an issue that came up in 10GE testing.

*SuggestedRemedy*

One possible solution would be to define an unframed PRBS test mode with no 64/66B encoding or scrambling enabled, to be used for testing all of the PMD optical parameters. However I am not sure how this would work for a MLD based interface (which needs the 64/66B encoding and MLD lane markers to operate) ?
