Slavick, Jeff — Avago Technologies

Comment Type **T** *Comment Status* **D** *pma tap control*

Allowing for Coefficient change requests to "trickle" in may cause interoperabily issues since different designs will respond to the trickle in different manners.

SuggestedRemedy

Change "for that tap is not_updated." to "for all taps is not_updated."

Proposed Response *Response Status* **W**

PROPOSED REJECT.

[changed sub-clause from 3.10.6.4 to 94.3.10.6.4]

See the response to comment #17.

Cl **94** *SC* **94.3.10.6.4** *P* **260** *L* **11** # 17

Slavick, Jeff — Avago Technologies

Comment Type **T** *Comment Status* **D** *pmd tap control*

Allowing for multiple tap change requests to be made simultaneously complicates the response behavior of the PMD when the change takes a given tap to or beyond its operating range. It also highly complicates the logic needed to deal with these circumstances (both at the edge, and in the center of the EQ range), and what was applied and was not applied is when a MIN/MAX response is given is dependent upon the link partner implementation, thus it's unknown. Which can cause interoperability issues.

SuggestedRemedy

Change "Coefficient increment and decrement update requests must not be sent in combination with initialize or preset."
to
"A tap coefficient increment or decrement update request must not be sent in combination with initialize, preset or other tap cofficient update requests."

Proposed Response *Response Status* **W**

PROPOSED REJECT.

[changed sub-clause from 3.10.6.4 to 94.3.10.6.4]

A similar comment against 802.3bj Draft 1.1 Clause 93 (comment 10097) was rejected with the following response.

It is agreed that Clause 72 is unclear on how the status report fields should be set when a parallel coefficient update results in a violation of the peak or steady state voltage constraints. That said, while Clause 72 allows parallel coefficient update requests, it does not require it. The implication is that an adaptation algorithm that cannot deal with ambiguity in status report corresponding to constraint violations with parallel coefficient updates may send individual coefficient updates serially. Conversely, an adaptation algorithm that is insensitive to this ambiguity may send coefficient updates in parallel if it wishes. Therefore, the initiator of coefficient updates has the ability to choose whether to send coefficient updates serially or in parallel and therefore there is no ambiguity imposed by the standard. It is an implementation consideration. The commenter does not provide sufficient justification constrain the implementation in the manner proposed in the suggested remedy.

Cl **91** *SC* **91.5.3.3** *P* **140** *L* **18** # 18

Slavick, Jeff — Avago Technologies

Comment Type **T** *Comment Status* **D** *error_indication*

Based on slides 10 & 11 from cideciyan_01_0512.pdf we must always have some form of error protection enabled when sending 256b/257b data streams. So allowing for error indication to be disabled when bypass mode is enabled doesn't allow us to meet MTTFPA since a single bit error can induce a false packet. (Corrupting a control 257b block that contains both TERM & START into a DATA)
In gustlin_01a_0712.pdf slides 10 & 11 the statement is that error dectection always occurs for option 4 (this is what we based the adoption of always sending TC blocks on). The ability to reach the 5ns latency is based on doing traling error detection which is implementation dependent and can add complexity.
So the specification needs to state that we always have some form of error detection/correction enabled.

SuggestedRemedy

Change "When FEC correction bypass is not supported or is disabled, the decoder shall indicate errors to the PCS and the value of FEC_error_indication_enable (see 91.6.2) has no effect. When FEC_correction_bypass is supported and enabled, this feature is enabled by the assertion of the FEC_error_indication_enable variable."
to:
"When FEC correction bypass is supported and enabled, the decoder shall indicate errors to the PCS and the value of FEC_error_indication_enable (see 91.6.2) has no effect. When FEC_correction_bypass is not supported or disabled, this feature is enabled by the assertion of the FEC_error_indication_enable variable."

Moore, Charles — Avago Technologies

Comment Type **TR** *Comment Status* **D** *pmd rx inteference tolerance*

Many TBD's in Table 94-17 make spec technically incomplete.
Also Assumed values a parameters are dimensionless gain (loss is negative) as a function of frequency in Hz. Elsewhere in the spec we use dB of loss and frequency in GHz. Should change to be consistent.

SuggestedRemedy

in Table 94-17
Change:
"COM"
to
"COM, including effects of added Gaussian white noise"

change COM values for Test 1 and Test 2 both to 1.5
change Insertion loss at 6.875 GHz for Test 1 to 12

change
"Real part of a_0 min"
to
"a_0 max"
change a_0 values for Test 1 and Test 2 to 1 and 2 respectively
add units for a_0 to dB

change
"Real part of a_1 min"
to
"a_1 max"
change a_1 values for Test 1 and Test 2 to 1.6 and 3.8 respectively
change units for a_1 to dB*GHz^-1/2
(gives 4.2 dB and 10 dB at Nyquist)

change
"Real part of a_2 min"
to
"a_2 max"
change a_2 values for Test 1 and Test 2 to 1.6 and 4.2 respectively
(gives 11 dB and 28.9 dB at Nyquist)
change units for a_2 to dB*GHz^-1

change
"Real part of a_4 min"
to
"a_4 max"
change a_2 values for Test 1 and Test 0.03 to 0.065 and 4.2 respectively
(gives 1.4 dB and 3.1 dB at Nyquist)
change units for a_4 to dB*GHz^-2

In note c of Table 94-17, change both instances of maximum to minimum.

In Annex 93A.2 page 317 make it clear the frequency "f" is given in GHz.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT.

Moore, Charles Avago Technologies

Comment Type **TR** *Comment Status* **D** *pmd rx inteference tolerance*

step 1) of the test says:

"Determine the COM of the test channel using the method in Annex 93A. Adjust the test channel Gaussian white noise level to achieve the COM target in Table 94-17."

But nowhere is the effect of added Gaussian white noise on COM defined.

SuggestedRemedy

In Annex 93A most likely in 93A.1.6, define

H_np= H_TP5A-TP5(f) * H_r(f) * H_ctl(f)

with
H_TP5A-TP5(f)= 10^(-0.07 * (f/12.89 GHz))

define
Gain_noise = sqrt(integ(|H_np|^2) from 0 to fb/2)

change 93A-23 to

sigma_G = sqrt((A_s*sigma_RJ)^2 + sigma_r^2 + sigma_noise^2)

sigma_noise = WGN_TP5A * Gain_noise
where WGN_TP5A is added white Gausian noise at TP5A.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Suggested changes are to Annex 93A.

Le Cheminant, Greg — Agilent Technologies

Comment Type **E** *Comment Status* **D** *pmd tx transition time*

I believe that "....where bits 1 to 9 are the run of 9 zeros." was intended to read "...where bits 1 to 9 are the run of 9 ones". This is what the previous text implies, and a PRBS9 pattern cannot have a run of 9 zeroes (unless it is inverted).

SuggestedRemedy

replace word 'zeros' with 'ones' as indicated.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

[changed sub-clause form 3.12.5 to 94.3.12.5]

See response to comment #222.

The PRBS9 test pattern is not supported by the 100GBASE-KP4 PHY. An alternate test pattern and methodology is expected. In this case, this comment will be OBE.

Cl **92** *SC* **8.3** *P* **168** *L* **28** # 25

Le Cheminant, Greg — Agilent Technologies

Comment Type **T** *Comment Status* **D**

I believe the intent of the statement "A fourth order 33 GHz Bessel Thomson filter is to be used for all transmitter signal measurements" is that the entire test system have this response. Placing a 33 GHz filter in front of an oscilloscope will have a system response less than 33 GHz, possibly much less depending on the oscilloscope frequency response.

SuggestedRemedy

Replace with: A test system with a fourth-order Bessel-Thomson low-pass response (-3 dB at 33 GHz) is to be used for all transmitter signal measurements

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

A test system with a fourth-order Bessel-Thomson low-pass response at 33 GHz (3 dB bandwith) is to be used for all transmitter signal measurements.

Cl **92** *SC* **8.3.3** *P* **171** *L* **12** # 26

Le Cheminant, Greg — Agilent Technologies

Comment Type **T** *Comment Status* **D**

Assuming that the square wave pattern referenced has sequential runs of 1's and 0's and not a 10101010 pattern (could not find 83.5.10 which has the pattern specs), a 1 UI wide histogram is appropriate to measure the noise as long as 1) the 1 UI wide histogram is positioned away from the 1-0 or 0-1 transition and 2) the use of the term noise is intended to mean any amplitude fluctuation from ideal including both random and deterministic components. (If deterministic components of the histogram are significant compared to the random, the histogram will have an RMS value that will not represent only the standard deviation of the random noise). If the square wave is a 10101010 pattern, the histogram window should be significantly less than 1 UI. (I don't believe this is the case and likely no correction is required). If the intent of the measurement is to determine the random noise, then the measurement process is the dual to jitter separation analysis, where the various amplitude interference components are determined. (This is available in oscilloscope solutions from multiple vendors) If the intent was to determine the RMS of the aggregate amplitude interferers, no change is required

SuggestedRemedy

Assuming the square wave pattern has long runs of 1's and 0's, and the measurement is intended to capture all amplitude interference (not just random noise) no change is required

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The square wave test pattern is (8 ones followed by 8 zeros). Please note > 8)The measurement should not include the measurement system noise.

The valid editing instructions are "change, delete, insert, and replace" as described on page 21 of the draft.

There are many instances of "add" and three instances of "append" used as editing instructions. These should all be "insert".

Also, many of the instructions that should be or are "insert" do not define where in tables new rows should be placed.

SuggestedRemedy

Change "add" and "append" editing instructions to "insert".
For all "insert" editing instructions, check that the insertion point is defined.

For example:

In 30.2.5, change: "Append the following into Table 30-7:" to "Insert the following at the end of Table 30-7:"

In 45.2.1.7.4, change: "Add the following rows to the bottom of Table 45-9:" to "Insert the following rows at the bottom of Table 45-9:"

In 45.2.1.100, change "Add rows & changed reserved row in Table 45-73 and add the paragraph to the end of 45.2.1.100:" to "Change the reserved row and insert new rows immediately below it in Table 45-73 and insert the new paragraph at the end of 45.2.1.100 as follows:". Do not show the new text in underline font.

In 73.11.4.3, change "Add item LE8a and change LE14, LE15, and LE17 as shown:" to "Insert item LE8a immediately below item LE8 and change LE14, LE15, and LE17 as shown:"

etc.

The modified text says: "For 1000BASE-PX, 10/40/100GBASE-R, 100GBASE-P PHYs, an array ..." which would be better as:
"For 1000BASE-PX, 10/40/100GBASE-R, and 100GBASE-P PHYs, an array ..."

Same issue in 30.5.1.1.18

SuggestedRemedy

Change:
"For 1000BASE-PX, 10/40/100GBASE-R, 100GBASE-P PHYs, an array ..." to:
"For 1000BASE-PX, 10/40/100GBASE-R, and 100GBASE-P PHYs, an array ..."

Make the same change in 30.5.1.1.18

Proposed Response *Response Status* **W**

PROPOSED ACCEPT.

Cl **45** *SC* **45.2.1.100** *P* **40** *L* **26** # 41

Anslow, Pete Ciena

Comment Type **E** *Comment Status* **D** *bucket*

The paragraph to be added at the end of 45.2.1.100:
Register field 1.1501.8 enables testing with the JP03A pattern defined in 94.2.11.1. Register field 1.1501.9 enables testing with the JP03B pattern defined in 94.2.11.2. Register field 1.1501.10 enables testing with the QPRBS13 pattern defined in 94.2.11.3. The assertion of register 1.1501.8, 1.1501.9, 1.1501.10 are mutually exclusive. If more than one bit are asserted the behavior is undefined. The assertion of 1.1501.8, 1.1501.9, and 1501.10 works in conjunction with register field 1.1501.3. If 1.1501.3 is not asserted then 1.1501.8, 1.1501.9, and 101501.10 have no effect.

is written using different terms from the text that is already present in this subclause. Since the existing paragraphs are not being changed, change this text to be in line with what is already there.

Also, "if more than one bit are asserted" should be "if more than one bit is asserted", "operates" seems a better word to use than "works" and "101501.10" should be "1.1501.10".

SuggestedRemedy

Change the paragraph to:
"Register 1.1501 bit 8 enables testing with the JP03A pattern defined in 94.2.11.1. Register 1.1501 bit 9 enables testing with the JP03B pattern defined in 94.2.11.2. Register 1.1501 bit 10 enables testing with the QPRBS13 pattern defined in 94.2.11.3. The assertion of bits 1.1501.8, 1.1501.9, 1.1501.10 are mutually exclusive. If more than one bit is asserted the behavior is undefined. The assertion of bits 1.1501.8, 1.1501.9, and 1501.10 operates in conjunction with register 1.1501 bit 3. If bit 1.1501.3 is not asserted then bits 1.1501.8, 1.1501.9, and 1.1501.10 have no effect."

Anslow, Pete Ciena

Comment Type **E** *Comment Status* **D** *bucket*

Inserting the text and figure with separate editing instructions is not necessary and is different from the way this has been done elsewhere in the draft.
There is no reference to the new figure in the text.
The figure number in the second editing instruction does not match that of the inserted figure.
The figure number should be 78-9 because two previous figures have been inserted in 78.4.2.5 (see separate comment about those figure numbers)

SuggestedRemedy

Remove the second editing instruction and change the first one to:
"Insert the following text and figure at the end of 78.5:"
Add a reference to the new figure in the text.
Change the figure number to 78-9.

The Working Group maintains a list of preferred spellings on its web pages.
Spellings in the draft not in accordance with this list are:
6 instances of Gbps instead of Gb/s
3 instances of inter-symbol instead of intersymbol
3 instances of low frequency instead of low-frequency
2 instances of peak to peak instead of peak-to-peak
20 instances of steady state instead of steady-state
2 instances of signal to noise instead of signal-to-noise
5 instances of common mode instead of common-mode (when used as an adjective)
3 instances of implementer instead of implementor
3 instances of boolean that should be Boolean

SuggestedRemedy

Change all instances to be in accordance with Working Group practice.

If an appropriate link exists, include it in the editor's note.

Cl **91** *SC* **91.5.4.3** *P* **148** *L* **45** # 98

Gustlin, Mark Xilinx

Comment Type **T** *Comment Status* **D**

Figure 91-8 is called the "FEC synchornization state diagram"
But in reality it is really performing a Alignment marker lock function, that happens to get you to FEC lock once you have all 4 FEC lanes AM locked, Figure 91-9 is the FEC alingment state diagram which makes sense.
In addition, the block in figure 91-2 that refers to what this state machine performs and what 91-9 does is called: Aligment lock and deskew, so there is a disconnect between the SM and the functional diagram.

SuggestedRemedy

Change the title of figure 91-8 to: "Aligment marker lock state diagram"
Note that this is the same as Figure 82-11, but how it is achieved is quite different.
Also change the reference to 91-8 in subclause 91.5.3.1.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

"Synchronization" is an appropriate term for the process of identifying the position of the alignment marker payload sequences inserted by the transmitter.

For a comparable example, consider IEEE 802.3-2012 82.2.11 with defines "block synchronization" using a process of identifying 2-bit synchronization headers inserted by the transmitter.

Dawe, Piers IPtronics

Comment Type **T** *Comment Status* **D** *return_loss*

I'm assuming this return loss spec is under review.
To control echoes on short channels adequately, the return loss spec must extend to a frequency where the echo is adequately attenuated by something else (e.g. a filter in the receiver). If the spec stops at 13 GHz, reflections at 13.1 GHz would dominate.
This applies to IC-to-IC links and also, as an IC that meets the 100GBASE-KR4 specification should be suitable for use in 100GBASE-CR4, to IC-to-cable echoes in 100GBASE-CR4, even if the cable has significant loss. Note that 100GBASE-CR4 specifies host return loss 10 MHz to 19 GHz and cable return loss 50 MHz to 19 GHz, so an implementer would have to deliver adequate performance up to 19 GHz for CR4 anyway. The equivalent OIF spec goes up to the signalling rate.

SuggestedRemedy

The new limit should extend to at least 15 GHz, preferably to 19 GHz.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change the frequency range to 0.05 to 19 GHz for the following 100GBASE-KR4 limits.

Transmitter differential output return loss, Equation (93-2)
Transmitter common-mode output return loss, Equation (93-3)
Receiver differential input return loss, Equation (93-7), unless removed per #107
Receiver common-mode output return loss, Equation (93-8), unless removed per #139 or #107
Receiver differential to common-mode return loss, Equation (93-9)

SuggestedRemedy

Add a sentence incorporating it by reference.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT.

Cl **92** *SC* **92.8.3.6.1** *P* **174** *L* **46** # 106

Dawe, Piers IPtronics

Comment Type **T** *Comment Status* **D**

This says "The reference voltage for pulse width measurements is the mid-point between the positive pulse amplitude and the negative pulse amplitude" while above, 92.8.3.6 says "The voltage threshold for the measurement of BER or crossing times is the mid-point (0 V) of the AC-coupled differential signal." It would be better to be consistent. Also, for a slow signal as is allowed here, the shorter pulses shrink in height, biasing the threshold to reduce the apparent even-odd jitter; this creates a major error. Changing the emphasis also changes the apparent even-odd jitter with this definition.
Instead, even-odd jitter can be found using an extension of the DDJ method in 85.8.3.8, so one measurement can provide two measured parameters.
A definition should specify the pattern, although the method here is a convenient diagnostic.
Incidentally "pulse level" would be more relevant than "pulse amplitude".

SuggestedRemedy

Replace the first paragraph with:
with
Even-odd jitter is defined for PRBS9. A correct measurement of even-odd jitter requires that the period of the test pattern is an even number of bits, so the test pattern for the purpose of even-odd jitter measurement must be two periods of the PRBS9.

Replace the second paragraph with:
Even-odd jitter is defined to be the magnitude of the difference between the mean time of all even-numbered crossings and the mean time of all odd-numbered crossings (see Figure 85-6 for an example of crossing numbering).

Put the second paragraph first.

Consider adding an informative NOTE describing the method of measuring 8 bits of alternating polarity.

Give editor licence to improve the text.

Proposed Response *Response Status* **W**

Remove Equation (93-6)/Figure 93-8 and refer to Equation (93-1)/Figure 93-3.

In 93.8.2.2:
Remove Equation (93-7)/Figure 93-10 and refer to Equation (93-2)/Figure 93-6.

Remove Equation (93-8) and refer to Equation (93-3), unless removed per #139.

Cl **92** *SC* **92.8** *P* **168** *L* **9** # 108

Dawe, Piers IPtronics

Comment Type **TR** *Comment Status* **D**

The following items are needed for a viable spec (technical completeness):
Host common-mode output return loss
Absorbs common-mode energy
Host mixed-mode output return loss or termination mismatch
Limits conversion of reflected common-mode signal into interfering differential signal
Cable common-mode return loss
Absorbs common-mode energy
Integrated common-mode conversion noise or differential to common mode through loss
Limits conversion into common mode that would otherwise exceed the AC common-mode output voltage spec - relevant to low loss cables in particular

These items are present in the recently issued InfinBand FDR spec.

SuggestedRemedy

Add specs:
Host common-mode output return loss, -2 dB, 50 MHz to 19 GHz
Host common mode to differential output return loss, 16-1.22f, 50 MHz to 19 GHz
Cable common-mode return loss, -2 dB, 50 MHz to 19 GHz
Integrated common-mode conversion noise, 40 mV.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Response in two parts:
(1)For committee discussion:
>Host common-mode output return loss, -2 dB, 50 MHz to 19 GHz
>Host common mode to differential output return loss, 16-1.22f, 50 MHz to 19 GHz
>Cable common-mode return loss, -2 dB, 50 MHz to 19 GHz

(2)Proposal lacking sufficient recommended changes to implement in the draft.
What parameter is integrated?
>Integrated common-mode conversion noise, 40 mV.

Cl **94** *SC* **94.3.13.3** *P* **276** *L* **40** # 109

Dawe, Piers IPtronics

Comment Type **TR** *Comment Status* **D** *pmd rx jitter tolerance*

Transmitter jitter is measured after a high-pass jitter filter. The receiver must be able to tolerate low frequency jitter, and the spec must require it. This could be enforced by including low frequency jitter in the receiver interference tolerance specification or by a separate jitter tolerance specification. The latter seems easier. A 2-point spec as used in e.g. 40GBASE-SR4 could be used (just two jitter frequencies rather than a mask).

SuggestedRemedy

Add a low frequency jitter tolerance specification to each of clauses 92, 93, 94, as a separate item (not part of receiver interference tolerance, but possibly using the same high loss channel). Make consistent with the transmitter jitter specs, in particular the 3 dB frequency of the jitter measurement filter used for transmitter output jitter measurement.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See response to comment #140.

Cl **91** *SC* **91.5.3.3** *P* **140** *L* **20** # 110

Dawe, Piers IPtronics

Comment Type **TR** *Comment Status* **D** *error_indication*

Transmitting in 257-bit transcoded format and not using FEC to identify errors gives a PCS Hamming distance of 1 rather than the 4 provided by 64B/66B. The mean time to false packet acceptance is poor, even at BERs when the link is usable (see cideciyan_01_0512.pdf but note that for short frames, the situation for 257b is about 20 times worse than shown). Warning the reader is not an adequate solution, because the user of Ethernet has to plug what he controls into a wider network that he doesn't control. Something that degrades this disgracefully and dangerously can't be called "Ethernet".

SuggestedRemedy

Make the FEC error indication function mandatory, always, for 257b.
If ultra-low latency really is important, look for another coding solution, sacrificing some throughput.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See #18.

Cl **91** *SC* **91.5.3.3** *P* **140** *L* **10** # 111

Dawe, Piers IPtronics

Comment Type **TR** *Comment Status* **D**

This says "The RS-FEC sublayer shall also be capable of detecting uncorrectable codewords." but doesn't say what constitutes an uncorrectable codeword, so it's toothless. If the FEC were to correct up to 7 symbol errors in a codeword, but pass 8 without comment, then there would be a MTTFPA problem: virtually all errors that got past the FEC would be too much for the CRC's guaranteed detection so would only get its statistical (all but 1 in 2^32) protection. But, I believe this RS code can detect up to 14 symbol errors in a codeword. With 257b coding, the standard needs to require that an implementation detect significantly more than 7, when it's correcting, so that the chance of an undetected error is tiny.

SuggestedRemedy

Define the mandatory level of detection of uncorrectable codewords, e.g. up to 14 symbol errors for 100GBASE-CR4 or 100GBASE-KR4.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

It is not possible for a RS(528,514) decoder to guarantee that all codewords with 8 or more errors in them are detected.

Specifically, the codeword with 8 errors has roughly a 1 in 1 million chance of not being detected (see [1]). Similar probabilities apply for 9 errors in a codeword, 10 errors, and so on.

Such performance is prohibitive to verify and therefore it may be better stated in terms of what was assumed for MTTFPA performance evaluation. This will alert users of the standard to this feature of the decoder architecture.

Add the following to the end of the second paragraph of 91.5.3.3.
"It is assumed that the likelihood of the decoder failing to indicate a codeword with t+1 errors as uncorrected is no more than 1E-6. This same likelihood is also assumed for t+2 errors, t+3 errors, and so on."

[1] R. J. McEliece and L. Swanson, "On the decoder error probability for Reed-Solomoncodes," IEEE Trans. Inform. Theory, vol. 32, pp. 701-703, Sep. 1986.

Cl **92** *SC* **92.10.3** *P* **182** *L* **8** # 112

Dawe, Piers IPtronics

Comment Type **TR** *Comment Status* **D**

The ILD limit is near to double the 40GBASE-CR4 limit (scaled for signalling rate). I don't believe this draft spec works, even with FEC, unless the ICs are much better than needed for 100GBASE-KR4. This draft is not "without technical issues".

SuggestedRemedy

If cables are going to have this much ILD, reflection and so on, change the maximum loss to something more realistic. Show that the spec has technical feasibility (i.e. will work without requiring better-than-KR4 ICs).

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The insertion loss allocation for the Tx/Rx PCB boards and the mated MDI connector IL scales higher. Min PCB loss 1.17 dB (12.8906 GHz) versus 0.67 (5.15625 GHz) dB and Max PCB loss 6.81 (12.8906 GHz) versus 3.5 dB (5.15625 GHz). In addition, the 1.17 dB loss is not a practical minimum for majority of host implementations. In general, expectation is more IL at TP2 for bj versus ba.

In addition, lack of clousure on system performance correlation to ILD has been one of the motivations to move to COM. With closure on COM, cable assembly ILD can be considered as the commentor suggests.

Cl **94** *SC* **94.3.12.9** *P* **275** *L* **24** # 113

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **D** *pmd tx sdr*

The subclause heading "Transmitter output noise and distortion" and the name of the parameter defined therein "signal to noise and distortion ratio (SNDR)" seem to be incorrect since the reference to 94.3.12.6.1 (which refers to 85.8.3.3.4) returns an averaged waveform. It is unclear what form of "noise" is included in the measurement since uncorrelated noise and jitter will be significantly attenuated by averaging.

SuggestedRemedy

Change subclause heading to "Transmitter distortion" and change the parameter name to "signal to distortion ratio (SDR)". For step 2, change "output noise and distortion error" to "output distortion error".

Proposed Response *Response Status* **W**

PROPOSED ACCEPT.

Cl **94** *SC* **94.3.12.9** *P* **275** *L* **29** # 114

Healey, Adam — LSI Corporation

Comment Type **T** *Comment Status* **D** *pmd tx sdr*

The RMS distortion error is computed for each phase m = {1, 2, ..., M} and the maximum value is used to compute SNDR. It unclear why all phases should be considered since a practical receiver will sample close to the center of the eye and distortion around the transitions will not be seen. Given that an averaged waveform is the basis for the SNDR measurement, EOJ is likely to be the major source of distortion around the transitions but this parameter is bounded separately. Note that it can be shown that the 19 dB SNDR requirement cannot be satisified if EOJ is 3% (maximum allowed value).

SuggestedRemedy

Constrain the computation of RMS distortion error to a window spanning no more than [-0.25, 0.25] UI relative to some a nominal sampling point near the eye center.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See brown_02_3bj_0113.

Cl **78** *SC* **78.5** *P* **67** *L* **44** # 115

Trowbridge, Steve — Alcatel-Lucent

Comment Type **T** *Comment Status* **D** *OTN*

Figure 78-7 Refresh phase is not needed for fast wake. This is something that is needed when the transmitter is turned off during the sleep state as a periodic "hello" to check that the link is up. Since the link remains up with continuous signaling, this is not needed for fast wake. Nor is the "Sleep" signaling needed, since FW signaling asserts LPI. Advance warning is needed if the transmitter is to be turned off, but no advance warning is needed to stop sending data and assert LPI. Note that this is one of several comments aimed to allow use of the same "Fast Wake" operation for optical interfaces.

SuggestedRemedy

Change to the necessary four states: Active, FW signaling, Wake, Active

Proposed Response *Response Status* **W**

PROPOSED REJECT.

See response to comment #117

If #117 is accepted in some form, then the editor suggests the following ACCEPT IN PRINCIPLE:

Change the figure to show Active, FW signaling, Wake, Active as suggested, add a note that states:

Note: FW signaling continually indicates LPI in a normally constituted data stream.

Cl **78** *SC* **78.5** *P* **67** *L* **32** # 116

Trowbridge, Steve — Alcatel-Lucent

Comment Type **T** *Comment Status* **D** *OTN*

Given that P802.3bm has adopted an EEE objective to support fast wake operation and assuming that fast wake signaling will be modified to be compatible with the OTN mapper, insert a warning that "Deep Sleep" operation must not be enabled for any 40 Gb/s or 100 Gb/s PHY that is transparently mapped over OTN.

SuggestedRemedy

Insert the indicated warning.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Although this is not strictly within the scope of this project, a warning can be added as a favor for the other project.

The text and diagram in 78.5 is ill-placed. It should have been added at the end of subclause 78.1.3.3.1. Move the text and diagram and add the following:

Warning: The signaling in deep sleep operation precludes transparent mapping of the link over Optical Transport Networks. Only fast wake operation should be enabled for any link that is intended for transparent OTN mapping.

Cl **82** *SC* **82.2.8a** *P* **99** *L* **44** # 117

Trowbridge, Steve — Alcatel-Lucent

Comment Type **T** *Comment Status* **D** *OTN*

Rapid Alignment marker insertion should only be done for the "refresh" and "wake" phases coming out of deep sleep. It should not be used for fast wake. See supporting presentation.

SuggestedRemedy

Separate the description of how "deep sleep" and "fast wake" modes of operation are handled. FW signaling should be done by sending continuous LPI control characters with normal alignment marker spacing (maintaining the alingment with the normal data stream), and transitioning to Idle control characters Tw before sending data resumes.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The BRC must be convinced that the value of this change outweighs the value of sending RAMs during FW. This discussion will take place in the TF.

If the premise of this comment is accepted, the editor suggests the following ACCEPT IN PRINCIPLE:

Change only the RAM definition subclause. Replace the first three sentences:

For the optional EEE function, an alternate method of alignment is used when operating in the deep sleep low power state. Rapid Alignment Markers (RAMs) function in a similar manner to the alignment markers described in 82.2.7. RAMs are sent in the place of normal alignment markers when the transmitter has an LPI transmit state other than TX_ACTIVE, LPI_FW = FALSE and down_count_done = FALSE.

Ghiasi, Ali — Broadcom

Comment Type **TR** *Comment Status* **D**

Current transmitter output allows total jitter excluding DDJ to be 0.28 UI. In cases transmitter have very low RJ then TJ which in this case can be all PJ could approch 0.28 UI, which will be more harmfull to the transmitter.

Current draft is incomplete as no test method has been provided to measure total jitter excluding DDJ, current test method would require real time scope with long record.

Comment 321 was submitted on D1.1 but wihtout consenous to make the change

SuggestedRemedy

Due to lack of test method and the fact total jitter could end up to be all PJ the proposed resultion is to repalce Total jitter excluding DDJ with "Total Jitter excluding DDJ and Random Jitter" which can easly be measured by capturing PRBS9 waveform per test mehotd of 85.8.3.3.

Repalce 0.28 UI with 0.15 UI for value of Total Jitter Excluding DDJ and Random Jitter

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

[Changed Subcl to 93.8.1.1 for consistent sorting.]

Total jitter (TJ) and data dependent jitter (DDJ) are defined in 93.8.1.8 (by reference to 92.8.3.6.2 and 92.8.3.6.3 respectively). DDJ is measured from a PRBS9 test pattern which limits the required record length.

PJ, or similar uncorrelated determinstic jitter (DJ), can be constrained by limiting effective DJ excluding DDJ. Effective DJ is an intermediate result for the computation of effective random jitter (see 92.8.3.6.3).

Add a limit for "Effective determinstic jitter excluding data dependent jitter" of 0.15 UI.

See #119.

Ghiasi, Ali Broadcom

Comment Type **TR** *Comment Status* **D**

Equation 92A-1 is not consistant with the TP0 to TP2 loss where coefficent SQRT(F) and f are about the same, but equation 92A-1 linear term is twice the SQRT term. Propose to use scale version of equation 92-4.

Same comment was submitted aginst D1.2 comment 222. Removing the connector loss which is only 1.2 dB will not result in the linear term of the host PCB to incrase by factor of 2! I am trying to make the host PCB to be consistant with the TP0 to TP2a loss.

SuggestedRemedy

If equation 92-4 is multipled by 0.7 then loss at 12.89 Ghz will be 6.8 dB
IL_Prop=0.0565+0.4263*sqrt(f)+0.4045*f where f is from 0.01 to 18.75 GHz.

ghiasi_01_0113 will proivde the supporting material

Proposed Response *Response Status* **W**

PROPOSED REJECT.

Equation (92A-1) is the PCB insertion loss. However the TP0-TP2 channel includes a connector, which will add to sqrt(f) loss and not scale linearly with length, and a TP2 test fixture.
Therefore, TP0-TP2 should not be linearly scaled from Equation (92A-1).

Change per comment skew at SP3 from 45 ns to 54 ns.

Cl **92** *SC* **92.7.5** *P* **165** *L* **41** # 142

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

This requirement is too restrictive. In a real system, the exit from LPI is caused by an ALERT signaling from the TX and through the channel that the RX was trained on. It's not any "channel meeting the requirements of 92.9" and "output amplitude of 720 mV" - the cable and transmitter cannot be replaced!

The current requirement precludes setting the voltage thresholds dynamically per case (TX and channel) - which is a more robust choice and possibly easier to implement than a fixed, "worst-case" threshold.

The updated text in clauses 84 and 85 does not have this problem.

Comment also applies to 93.7.5.

SuggestedRemedy

rephrase (based on new text in 84.7.4 and 85.7.4):

When rx_mode is set to QUIET, PMD_signal_detect_i shall be set to one within 500 ns following the application of a signal at the receiver input that corresponds to an ALERT tx_mode (see 92.7.2) of the link partner. PMD_signal_detect_i shall be held at zero as long as the signal at the receiver input corresponds to a QUIET tx_mode (see 92.7.6) of the link partner.

Change 93.7.5 similarly with the respective cross references.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Replace the 3rd sentence of 3rd paragraph of 92.7.5 with:

"While rx_mode is set to QUIET, PMD_signal_detect_i shall be set to one within 500 ns of the application of the ALERT pattern defined 92.7.2, with peak-to-peak differential voltage of 720 mV measured at TP2, to the differential pair at the input of the cable assembly that connects the transmitter to the receiver of lane i. While rx_mode is set to QUIET, PMD_signal_detect_i shall not be set to one when the voltage input to the differential pair of the cable assembly that connects the transmitter to the receiver of lane I is less than or equal to TBD mV peak-to-peak differential."

Set TBD to twice the minimum differential output voltage for transmitter disabled (70 mV for 100GBASE-CR4, 60 mV for 100GBASE-KR4 and 100GBASE-KP4).

Change 384 to 348.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT.

Cl **92** *SC* **92.8.3.3** *P* **171** *L* **12** # 145

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

Square wave test pattern is from 83.5.10 which is optional to implement. A 100GBASE-CR4 PMD is likely integrated with a PMA. If the PMA does not implement this optional feature then this test cannot be performed.

Comment also applies to 93.8.1.7 although the test pattern is not explicitly refernced there. It also applies to clause 85.8.3.2.

SuggestedRemedy

Further discussion is required, but for the time being, add editor's notes that this text should be changed to make sure the test can be performed.

Some options for rectification (neither is perfect):
1. Change 83 to make the square wave pattern mandatory
2. Add a mandatory square wave pattern function in the PMD management
3. Change the TX noise test to use a different apttern and method (e.g. distortion analysis as done in clause 94).
4. (recommended) specify that a CR4 PMD must be attached to a PMA which support s the optional square wave test pattern.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

It's not necessary to specify implementation.

Cl **92** *SC* **92.8.3.2** *P* **171** *L* **17** # 146

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

By definition, the measurement includes the measurement system noise. If it should be excluded or calibrated, then the text should describe how it should be done.

Comment applies also to clause 93.8.1.7 (which only refers back to 85.8.3.2). and to 85.8.3.2 (which may be out of scope).

The test implicitly assumes measurement system noise comparable to or below 1 mV RMS, otherwise the TX noise is under the noise floor. This may not be the case in all 25G measurement setups. It should at least be noted as a recommendation.

SuggestedRemedy

Change item (8) to read

"The transmitter under test is turned off and the RMS noise of the measurement system is calculated. Denote sigma_0l and sigma_0h as this RMS value for the low-loss and high-loss cable assembly, respectively. For accurate measurement, sigma_0l and sigma_0h should be lower than 1 mV."

Add the measurement noise term to equation 92-2:

RMSl_dev <= sqrt(sigma_l^2 + sigma_0l^2 + 2^2)

Change equation 92.3 accordingly.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Add sentence: "It may be necessary to correct for test system noise." After sentence: "The measurement should not include the measurement system noise. "

Cl **92** *SC* **92.8.3.4.1** *P* **172** *L* **43** # 147

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

If peak value of p(k) is 0.5 of v_f, it means that the rise time of a step at TP2 (in preset setting) is 2 UI. This is not reasonable; the TXFFE coefficients won't be able to compensate for the combination of such a slow TX and a long cable.

For comparison, clause 85 value is 0.63 of "TX DC amplitude" (which is equivalent to v_f) with the same TXFFE coefficient range, and similar insetion loss assumption for both cable and host board.

SuggestedRemedy

Change requirement to 0.63 x v_f here and in table 92-6, also update PICS item TC16 accordinlgy.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The host loss basis for 85 (TP2) is different than 92.

Cl **92** *SC* **92.8.3.4.2** *P* **172** *L* **50** # 148

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

The linear fit error requirement is based on the measurement procedure defined in 85.8.3.3. This procedure does not address measurement noise (it only recommends "averaging multiple waveform captures", which may reduce noise to its mean, but not below).

It is possible that limited resolution of scopes and other measurement noises dominate the measurement results and prevent achieving the required normalized error.

To meausre the TX characteristics, one should be allowed to measure the noise and calibrate the measurement accordigly. One way of doing that is to connect a precision sine wave generator in place of the DUT, generate a sine wave with the same amplitude as the TX, capture the waveform, calculate a sinusoidal fit, and measure the fitting error. The noise correction obtained from this procedure should be limited in order to ensure meaningful results.

SuggestedRemedy

My proposed change is a detailed description. Editorial license is granted.

Change this paragraph to read:

The linear fit noise shall be limited by the following procedure (using definitions in 85.8.3.3).

1. Denote E_RMS as the RMS of e(k).
2. Connect a sine wave generator in place of the DUT and set it frequency to 12.9806 GHz and its amplitude to the peak value of p(k).
3. Capture the waveform of the sine wave signal, with the same method and settings used to capture y(k). Denote the result as y_cal(k).
4. Denote Y_cal(n) the two-sided FFT of y_cal(k).
5. Calculate the normalized measurement noise N_RMS_norm as the result of:

N_POWER = sum (f from 0 to M*fBaud) (abs(f) ^2) - 2*sum(f from 12.85 GHz to 13.11 GHz) (abs(f) ^2)
N_RMS_norm = sqrt(N_POWER)/peak(p(k))

For meaningful measurements, it is recommended that N_RMS_norm be less than 0.01.

6. Denote E_cal_RMS as sqrt((E_RMS/peak(p(k))^2 - min(N_RMS_norm, 0.01)^2)) (to exclude calibrated measurement noise up to 0.01 of peak(p(k))).

e_cal_RMS shall be less than 0.037.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The procedure provides sufficient information to implement and recommendations to reduce noise which can be realized in available equipment.

Cl **92** *SC* **92.8.3.6.1** *P* **174** *L* **37** # 149

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

Comment also applies to 93.8.1.8.

Current definition of Even-odd jitter is based on the polarity of the pulses (compare positive pulses and negative pulses). This can bias the results due to any effect that causes positive/negative width difference rather than the even/odd that we actually want to limit. One such effect is difference between rise and fall times, but there may be others as well.

The combined effect of even/odd and positive/negative jitter can lead to inconsistend results (depending on whether they add or cancel each other).

If the test pattern is two periods of an odd-length base pattern (such as PRBS9), then the positive pulses occur at even indices in one period and at odd indices in the other. Choosing pulses from only one of the two periods may cause differrent results depending on which of the two periods is selected.

It is important that the measurement instructions follow what we actually want to measure.

Defining a procedure that would cover both even- and odd-length arbitrary patterns is difficult. But we already have a well-defined method in clause 94 that is tailored to measure EOJ rather than polarity-related jitter. It is proposed to use that method, instead of the current definitions.

SuggestedRemedy

Delete the first two paragraphs of 92.8.3.6.1.

Refer to the test pattern and measurement method defined in 94.3.12.8.2, or copy and modify it, with editorial license, here and in 93.8.1.8.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change the definition of even-odd jitter to the following:

"Even-odd jitter is measured on two repetitions of a repeating pattern with an odd number of bits and at least two transitions between one and zero or zero and one. PRBS9 is such a pattern. The deviation of the time of each transition time from the an ideal clock at the data signaling rate is measured. Even-odd jitter is defined as the magnitude of the difference between the average deviation of all even number transitions and the the average deviation of all odd number transitions, where counting of transitions to determineing if it a transition is even or odd is based on possible transitions but only actual transitions are measured and averaged.

Even-odd jitter shall be less than or equal to 0.035 UI regardless of the transmit equalization setting.

NOTE-Even-odd jitter has been referred to as duty cycle distortion by other Physical Layer specifications for operation over electrical backplane or twinaxial copper cable assemblies (see 72.7.1.9). The term even-odd jitter is introduced here to distinguish it from the duty cycle distortion referred to by Physical Layer specifications for operation over fiber optic cabling."

Cl **92** *SC* **92.8.4.3.5** *P* **179** *L* **18** # 150

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

Scrambled idle, like any data, is striped across the four lanes in a way that is not easily recoverable when looking at a single lane in the RX PMD. Also, generatuing a single-lane portion of scrambled idle requires a complex pattern generator.

Using a PCS-oriented data pattern for BER testing at the PMD interface does not make architectural sense, and would require additional hardware in the PMA.

For BER testing at the PMD, only PRBS31 should be used, and that would require the attached PMA to support PRBS31 checking.

SuggestedRemedy

Specify using PRBS31 as the BER test pattern.

Add a requirement that a PMA attached to a 100GBASE-CR4 PMD must support the ability to check received PRBS31 test patterns (PRBS31_Rx_checker_ability, refer to 83.5.10).

May be OBE if 4-lane, MAC-level FER test is adopted instead.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Response in two parts:

(1)Specify using PRBS31 as the BER test pattern.
Response: For committee discussion

(2)Add a requirement that a PMA attached to a 100GBASE-CR4 PMD must support the ability to check received PRBS31 test patterns (PRBS31_Rx_checker_ability, refer to 83.5.10).
Response: Other methods to generate test patterns other than PMA are possible and therefore imposing requirement on PMA is unnecessary and possibly burden implementations.

Cl **92** *SC* **92.14.4.4** *P* **206** *L* **26** # 151

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

There are two PICS items for AC coupling, this one is incorrect - it isn't part of the receiver. Oddly, the other PICS item, CA17, points to subclause 92.8.4.5 which discusses the receiver (I submitted anouther comment to move this subclause) , and also lacks the "CBL" modifier that makes it relevant only for cable manufacturer. it is the only item in this table which has these features.

SuggestedRemedy

Delete RC10.

Add "CBL:" to CA17, and make sure points to the right place.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Delete RC10. For CA17 change M to CBL:M

Replace text in subclause 92.8.4.5.

With: The receive lanes are AC coupled; the coupling capacitors are contained within the plug connectors as specified in 92.12.1.

Replace: last sentence 92.12.1

With: For Style-1 and Style 2 100GBASE-CR4 plug connectors the receive lanes are AC coupled; the coupling capacitors shall be within the plug connectors. It should be noted that there may be various methods for AC coupling in actual implementations. The low frequency 3 dB cutoff of the AC coupling shall be less than 50 kHz.

It is recommended that the value of the coupling capacitors be 100 nF. The capacitor will limit the inrush charge and baseline wander.

Delete: Sentence in 92.12.1.1
The plug connectors on the receive lanes are AC coupled, i.e. the coupling capacitors are contained within the plug connectors.

Delete: Sentence in 92.12.1.2
The plug connectors on the receive lanes are AC coupled, i.e. the coupling capacitors are contained within the plug connectors.

Ran, Adee Intel

Comment Type **E** *Comment Status* **D** *error_indication*

Variable name should suggest the ability/option to disable error indication (which is enabled by default), similar to the option of bypassing correction.

SuggestedRemedy

Change FEC_error_indication_enable to FEC_bypass_indication_enable here and elsewhere (rename and negate logically).
Rename MDIO control variable accordingly.
Change description in 91.6.2 as well.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See #18. The sense of this variable is moot if the ability to bypass error indication is removed.

Cl **91** *SC* **91.7.4.2** *P* **157** *L* **12** # 159

Ran, Adee Intel

Comment Type **E** *Comment Status* **D** *bucket*

In RF3, "capable of" makes sense, since there is an option to bypass error correction; but the behavior of actually correcting the errors (not just "being capable") is not stated. Compare to the error indication function which is clearly stated in RF6.

In RF4, there is no option to bypass, so "capable of" is should be replaced by the expected behavior.

SuggestedRemedy

Change RF3 to read:
"When enabled, corrects any combination of up to t=7 symbol errors in a codeword"

And change RF4 to read:

"Corrects any combination of up to t=15 symbol errors in a codeword"

Editorial license granted.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Clause 91 does not restrict the use of correction bypass to 100GBASE-CR4 and 100GBASE-KR4 PHYs.

Change RF3 to read:
"Corrects any combination of up to t=7 symbol errors in a codeword unless correction bypassed"

Change RF4 to read:
"Corrects any combination of up to t=15 symbol errors in a codeword unless correction bypassed"

Comment Type **E** *Comment Status* **D** *bucket*

The equation defines limits, not exact values, so "meet the values" is inadequate.

SuggestedRemedy

change "meet the values" to "be within the limits".

Proposed Response *Response Status* **W**

PROPOSED REJECT.

This language (i.e., measured return loss values are greater than or equal to values determined by equation) is used throughout this clause (and 85), would need to change througout (92) and understood given usage in 85.

Cl **92** *SC* **92.10.5** *P* **184** *L* **44** # 168

Ran, Adee Intel

Comment Type **E** *Comment Status* **D** *bucket*

The descriptions of NL_i(f), and of i ("is the 0 to 3 (pair-to-pair combination)"), is unclear and possibly wrong. "Combination" suggests all NEXT aggressor/victim pair combinations, and there are 16 of these, not 4.

SuggestedRemedy

Change description of NL_i(f) to "is the NEXT loss at frequency f from transmit lane i into the victim receive lane, in dB".

Change description of i to "is the transmit lane index".

Proposed Response *Response Status* **W**

PROPOSED REJECT.

First paragraph (92.10.5) describes MDNEXT as four lanes (individual NEXT) into a receive lane.
MDNEXT is determined for each receive lane from four lanes (individual NEXT).

Cl **92** *SC* **92.11.1.2** *P* **187** *L* **48** # 169

Ran, Adee Intel

Comment Type **E** *Comment Status* **D** *bucket*

How should the differences be accounted for? This suggests some form of de-embedding, but to a non-flat baseline, which is uncommon.

If we allow a tester to modify the result in some way, we'd better to specify exactly how and to what extent. Otherwise, any "accounting" can be done and anything can be made to pass or fail.

comment also applies to 92.11.2, page 188, line 13.

SuggestedRemedy

Preferably, delete this sentence.

Otherwise add an editor's note that this accounting should be specified in more detail.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

As the commenter points out, there are options to account for the effects of differences between the insertion loss of an actual test fixture and the reference insertion loss. The text does not constrain the implementation of accounting for the differences.

Comment Type **E** *Comment Status* **D** *bucket*

Why is the PMD "per 92.7" here? 92.7 is labeled "functional specifications".

There is only one PMD and one cable assembly defined in this clause, so their identities are implicit, without need to refer to 92.7 and 92.10.

It is suggested to refer to figure 92-2 for illustration instead.

SuggestedRemedy

Change
"The 100GBASE-CR4 PMD, as per 92.7, is coupled to the cable assembly, as per 92.10, by the MDI"
to
"The 100GBASE-CR4 PMD is coupled to the cable assembly by the MDI, as illustrated in figure 92-2".

Also, delete "of 92.7" and "of 92.10" in line 47.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

Text provides convenient subclause references.

The 100GBASE-CR4 PMD, as per 92.7, is coupled to the cable assembly, as per 92.10, by the MDI.

Comment Type **ER** *Comment Status* **D**

"most recently received block" is not well defined since the four blocks are received into the RS-FEC sublayer in parallel, at separate PCS lanes. Re-ordering can also occur. Please clarify.

SuggestedRemedy

Change "the most recently received block" to "the block received from the highest numbered PCS lane (after lane re-ordering)".

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The text refers to blocks received by the 64B/66B to 256B/257B transcoder which follows the alignment marker removal function. The alignment marker removal function outputs a stream of 66-bit blocks. See 91.5.2.4.

"After all PCS lanes are aligned and deskewed, the PCS lanes are multiplexed together in the proper order to reconstruct the original stream of blocks and the alignment markers are removed from the data stream."

The text is correct as written.

Cl **91** *SC* **91.5.2.5** *P* **133** *L* **46** # 179

Ran, Adee Intel

Comment Type **ER** *Comment Status* **D**

Current text says "For each 257-bit block, bit 0 shall be the first bit transmitted". But the bits in each block are distributed over 4 lanes; if bit 0 s in lane 0, then it is transmitted at the same time as bits 10, 20 and 30 in other lanes.

Similar bit-order instructions appear toward the end of this subclause, in page 136 lines 24 and 29.

In fact, the next logical step and the place where bit order matters is packing bits into RS-FEC symbols. The text does not describe how this is done. Notably, the bit order within symbols, and whether the 5-bit pad occupies the 5 LSBs or 5 MBSs of a symbol, are not obvious from the text.

SuggestedRemedy

1. Delete the sentence "For each 257-bit block, bit 0 shall be the first bit transmitted".

2. Change two occurences of "the first 1285 message bits to be transmitted from..." to "the first 1285 message bits to be packed into 10-bit symbols in..."

2. Add the following in the beginning of 91.5.2.7:

"The bit stream created by the transcoding and alignment mapping insertion is taken in groups of 10 bits to create 10-bit symbols. The order of symbols is such that bit 0 of each 257-bit block is included in one symbol, bit 10 of the same block is included in the next symbol, and so on. Within each symbol, bit order is such that bit 0 of each 257-bit block has lower significance than bit 1 of the same block"

Editorial license is given and should probably be applied for everything above.

Also, a new figure providing a graphical description of packing bits into symbols would help.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The text is correct within the context of the functional blocks.

This behavioral description does not imply parallel transmission between the alignment removal, transcode, alignment insertion, and Reed-Solomon encoder functions. It is pointed out in #178 that the output of the alignment removal function is a single stream of 66-bit blocks. The degree of parallel processing is implementation specific.

Bits are packed into the message of a Reed-Solomon codeword as defined in 91.5.2.7 page 136 line 2. The proposed definition is less specific in that is does not require bit 0 of the first 257-bit block to coincide with bit 0 of the first Reed-Solomon symbol in the codeword.

Figure 91-6 illustrates the bit ordering between various functional blocks.

Cl **91** *SC* **91.5.3.4** *P* **140** *L* **37** # 180

Ran, Adee Intel

Comment Type **ER** *Comment Status* **D**

Bits are received on four lanes in parallel. Bit 0 is received at the same time as bits 10, 20, and 30 (asuming correct alignment).

This comment applies also to subclause 91.5.3.5, line 51 of the same page.

SuggestedRemedy

Change "bit 0 is the first bit received" to "bit 0 is the first bit received on FEC lane 0" in both places.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

The text is correct in the context of the alignment marker removal function.

This behavioral model does not imply and parallel transmission between blocks. The data is presented as a stream of FEC codewords by the Lane reorder function. See 91.5.3.2, page 139, line 1.

"After all FEC lanes are aligned, deskewed, and reordered, the FEC lanes are multiplexed together in the proper order to reconstruct the original stream of FEC codewords."

Ran, Adee Intel

Comment Type **ER** *Comment Status* **D**

The text suggests that figure 92-9 uses the maximum values of fitting coefficients, but note (a) of table 92-11 says that would exceed the max IL limit. I assume the graph in figure 92-9 shows a fitted IL that does not exceed the limit.

Also, missing period at end of sentence

Also the "Meets equation constraints" label in the figure suggests that this line is a limit line, which isn't the case. The only constraint that can be shown to be met on the graph is the IL at 12.8906 GHz.

SuggestedRemedy

Change the text from
"The fitted insertion loss corresponding to one example of the maximum insertion loss at 12.8906 GHz and the maximum allowed values of a1, a2, and a4 are illustrated in figure 92-9"
to
"One example of the fitted insertion loss corresponding to the maximum insertion loss at 12.8906 GHz and allowed values of a1, a2, and a4 is illustrated infigure 92-9.".

Consider adding the coefficient values that are used in this example to figure 92-9 caption or within the text.

Change figure 92-9 caption to read "Example of cable assembly fitted insertion loss".

In the graph, mark the IL at 12.8906 GHz to show that it meets the requirements. The "Meets equation constraints" label should be changed to "Meets max loss" with an arrow pointing to this marker, or just be deleted.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Ran, Adee Intel

Comment Type **T** *Comment Status* **D** *Delay*

Note for 100GBASE-CR4 PMD says "Does not include delay of cable medium". Copper cable PMDs (40GBASE-CR4 100GBASE-CR4) are the only cases where such exclusion is made.

Why should this delay be left for network planners and administrators to calculate? The cable medium delay per meter is known (Based on table 80-3 it is about 10 ns/m). For 5 meters, this is 50 ns, which dominates over the suggested 100GBASE-CR4 PMD delay.

Accounting for the maximum medium delay will make it easier to calculate total network delay in this case (compare to the backplane PMDs whose medium delay is included; see 84.4).

For optical PMD types, table 80-3 includes 2 m of fiber, which is a precedence for including the delay of a functionally comparable medium.

SuggestedRemedy

Change maximum delay for the 100GBASE-CR4 PMD to 16 pause_quanta (and corresponding bit time and ns values).
Change the note to "includes 5 m of cable. see 92.4"

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

For consistency with base standard, insert "Includes delay of one direction through backplane medium." in the two backplane PMD rows.

Ran, Adee Intel

Comment Type **T** *Comment Status* **D** *error_indication*

Error marking was declared as mandatory when FEC is enabled during the November 2012 meeting. But disabling FEC decoding compeletely (to minimze latency) is still possible.

If error marking is optional when FEC_correction_bypass is enabled (creating a totally MTTFPA-unsafe link), it is all the more reasonable to make it optional when FEC_correction_bypass is not enabled (which would have a milder impact on MTTFPA under the same conditions, and is thus safer than turning correction off).

A supporting presentation will be submitted.

SuggestedRemedy

Change this paragraph to read

The Reed-Solomon decoder shall provide the ability to indicate errors to the PCS sublayer by intentionally corrupting 66-bit block synchronization headers. The decoder may provide an option to disable error indication in order to reduce the delay contributed by the RS-FEC sublayer. The presence of this option is indicated by the assertion of the FEC_bypass_indication_ability variable. When the option is provided, it is enabled by the assertion of FEC_bypass_indication_enable variable.

Modify management registers and PIC statesments (RF7) accordingly.

Proposed Response *Response Status* **W**

Comment Type **T** *Comment Status* **D**

"medium" can be interpreted as the cable assembly but seems to refer only to the MDI. It would be better to include the cable delay as well, and increase the total, as the cable delay is dominant.

Assuming cable delay is included, the total delay should be increased by 60 ns (from the original 20.48 ns), and rounded to 16 pause_quanta.

SuggestedRemedy

Change this paragraph to read:

"The sum of the transmit and the receive delays at one end of the link contributed by the 100GBASE-CR4 PMD, AN, and MDI, plus the delay through medium in one direction, shall be no more than 8192 bit times (16 pause_quanta or 81.92 ns). It is assumed that the one way delay through the medium is no more than 6000 bit times (60 ns)."

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See Figure 92-1 clearly depicting medium below MDI.

In>Table 80-3 the sublayer delay constraints for 100GBASE-CR4 PMD
are listed as [2048 max (bit time)] [4 max (pause_quanta)] [max (ns) 20.48]
that does not include delay of cable medium. See 92.4.

In>92.4:
The sum of the transmit and the receive delays at one end of the link contributed by the 100GBASE-CR4 PMD, AN, and the medium in one direction shall be no more than 2048 bit times (4 pause_quanta or 2048 ns). It is assumed that the one way delay through the medium is no more than 6000 bit times (60 ns).

To reconcile Table 80-3 with 92-4.
Change sentence above (In>92.4) by deleting "and the medium in one direction"

The sum of the transmit and the receive delays at one end of the link contributed by the 100GBASE-CR4 PMD and AN shall be no more than 2048 bit times (4 pause_quanta or 2048 ns). It is assumed that the one way delay through the medium is no more than 6000 bit times (60 ns).

Ran, Adee Intel

Comment Type **T** *Comment Status* **D**

Text in this paragraph is somewhat confusing. Rephrasing is suggested.

Also, propose replacing the TBD ns to 1100 ns, which is the minimum time spent in TX_ALERT state according to table 82-5a.

SuggestedRemedy

Change this paragraph to read:

If the optional EEE capability with deep sleep is supported, the following requirements also apply:

When tx_mode is changed from DATA to QUIET, the peak-to-peak differential output voltage shall be less than 30 mV within 500 ns of the transmitter being disabled. The DC common-mode output voltage shall be maintained to within mV of the value for the enabled transmitter.

When tx_mode is changed from QUIET to ALERT, the peak-to-peak differential output voltage shall be greater than 720 mV within 500 ns of the transmitter being enabled and shall meet the requirements of 92.8.1 within 1100 ns of the transmitter being enabled.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

See comment #88 for replacing the TBD.
For changing paragraph text, committee discussion.

Functional specifications items for optional EEE, like the ones added to 85.13.4.1, are missing.

SuggestedRemedy

Add items similar to those added to 85.13.4.1 to this table.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Functional specifications items for optional EEE like the ones added to 85.13.4.1 are in 92.14.4.2 Management functions. Editor to implement consistent PICS items for IEEE in 85 and 92.

Cl **80** *SC* **80.4** *P* **84** *L* **26** # 210

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D** *Delay*

The base document says "See 44.3 for the calculation of bit time per meter of fiber or electrical cable."

44.3 includes equation and table which implicitly assume BT = 100 ps (since clause 44 is "Intro to 10 Gb/s"). This is adequate for all 10G PHYs, but not for 40G and 100G PHYs, which are the subject of clause 80.

SuggestedRemedy

Add an instruction to change the sentence
"See 44.3 for the calculation of bit time per meter of fiber or electrical cable."
to the following text (adding a new equation 80-1):

<start replacement text>
Equation (80-1) specifies the calculation of cable delay in nanoseconds per meter of fiber or electrical cable, based upon the parameter n, which represents the ratio of the speed of electromagnetic propagation in the fiber or electrical cable to the speed of light in a vacuum, c = 3x10^8 m/s.

cable delay = 10^9/(n*c)[ns/m] (80-1)

The value of n should be available from the fiber or electrical cable manufacturer, but if no value is known then a conservative delay estimate can be calculated using a default value of n = 0.66, which yields a default cable delay of 5 ns/m.
<end replacement text>

There is no need to include a table as in 44-3 - this table is a simple arithmetic result of the formula. There is also no need to have separate equations for delays in BT units, since the conversions to BT are described in the notes of table 80-3.

Proposed Response *Response Status* **W**

PROPOSED REJECT.

Such a wide ranging change to the media delay calculation description should be a topic for maintenance.

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D** *Alert*

"While rx_mode = QUIET, SIGNAL_DETECT changes from FAIL to OK only after a valid ALERT signal is applied to the channel."

This requires the receiver to check the validity of the ALERT signal. What is really required is discrimination of ALERT vs. QUIET; behavior in the "gray area" need not be defined. Reasonable implementations may "detect" various strong signals other than ALERT, but as long as they are not valid QUIET signals, EEE functionality is not impacted.

comment also applies to 85.7.4, page 126, line 22.

SuggestedRemedy

Change the sentence above to read

"While rx_mode = QUIET, SIGNAL_DETECT shall be held at FAIL as long as the signal at the receiver input corresponds to a QUIET tx_mode (see 84.7.6) of the link partner."

Similarly for clause 85.

Dudek, Mike QLogic

Comment Type **T** *Comment Status* **D**

The Maximum insertion loss of the mated test fixture is contained in Equation 92-26 not Equation 92-27. Also using the maximum insertion loss is not really valid because the test results are to be adjusted based on any deviation from actaul printed circuit board loss from the nominal loss of the test boards. Also we have the Editors note on Page 189 pointing out that the Mated test fixture loss is 4.11dB at 12.8906GHz (which is between the minimum and maximum loss.

The same problem exists for the minimum loss on line 31

SuggestedRemedy

Change this definition from "is the maximum insertion loss of the mated test fixture using Equation(92-27)" to "is the nominal insertion loss of the mated test fixture using Equation new"

Add Equation new. ILmatedTF(f)(nom) = 0.114*sqrt(f)+ 0.2869*f. (Note that this equation has 4.11dB loss at 12.8906 GHz and is scaled from the minimum loss equation 92-27).

Make the same change on line 31 (pointing to the same new equation).

Delete the editors note on page 189.

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change this definition from "is the maximum insertion loss of the mated test fixture using Equation(92-27)" to "is the nominal insertion loss of the mated test fixture using Equation new"

Add Equation new. ILmatedTFnom(f) = 0.1148*sqrt(f)+ 0.287*f.
(Note that this equation has 4.11dB loss at 12.8906 GHz and is scaled from the minimum loss equation 92-27.

Make the same change on line 31 (pointing to the same new equation).

Comment Type **TR** *Comment Status* **D**

The peak to peak amplitude of the signal at TP2 is unlikely to be 720mV with 10.37dB loss between TP0 and TP2. This is an un-realistically large voltage to be achieved.

SuggestedRemedy

Either
a) Preferably reduce the requirement from 720mV to 220mV
or
b) change the test point to TP0 by adding "at TP0" between "differential output voltage" and "Shall be greater than 720mV".

Proposed Response *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

The requirement applies for when tx_mode=ALERT, i.e. a square wave with a period of 16 UI is transmitted and the transmitter equalizer coeffiicents are set to their preset values. Thus, there will be no de-emphasis and the TP0-TP2 should have a limited impact.

Change:
"When the transmitter is disabled, the peak-to-peak differential output voltage shall be greater than 720 mV within 500 ns of the transmitter being enabled and shall meet the requirements of 92.8.1 within TBD ns of the transmitter being enabled."

To:
"When the transmitter is disabled, the peak-to-peak differential output voltage shall be greater than 720 mV within 500 ns of the transmitter being enabled. The transmitter is enabled by the assertion of tx_mode=ALERT and this requirement applies when the transmitted symbols are the periodic pattern defined in 92.7.2 and the transmitter equalizer coefficients are assigned their preset values. The transmitter shall meet the requirements of 92.8.3 within TBD ns of the transmitter being enabled." [TBD set by #88]

This paragraph on effective RJ is inaccurate, self-inconsistent, and confusion

SuggestedRemedy

Replace the text with the following new paragraph:

The effective random jitter (RJ) of a signal is defined as the difference between the TJ and effective deterministic jitter (DJ). Effective DJ is derived from the BER vs sampling time distribution. BER vs sampling time distribution can also be obtained from jitter probability distribution via integration. The estimation procedure is as follows.

a) Convert the BER vs sampling distribution to Q vs sampling time distribution, via Q(ts)= sqrt(2) erfinv(1-(1/TD) BER (ts)), where TD is the transition density and is assumed as 0.5, and erfinv is inverse error function
b) Measure the sampling time distance from Q(ts) distribution for Q6 = 4.753, and denote it as TJ6, repeat the similar measurement for Q9 = 5.998, and denote it as TJ9
c) Effective DJ is calculated as DJ = (Q9xTJ6-Q6xTJ9)/(Q9-Q6)
d) Effective RJ is calculated as RJ=TJ-DJ

Proposed Response *Response Status* **W**

PROPOSED REJECT.

From the comment, it is unclear in what the problem is with the current definition, or what the advantage of the new definition is.

Cl **91** *SC* **91.5.3.3** *P* **140** *L* **25** # 281

Cideciyan, Roy IBM

Comment Type **TR** *Comment Status* **D** *error_indication*

Statement on line 25 contradicts the statement in previous paragraph (line 20). It is stated that "when FEC correction bypass is not supported or is dis
abled, the decoder shall indicate errors to the PCS and the value of FEC_error_indication_enable (see 91.6.2) has no effect." However, the next paragraph states that "the error indication function ... or contains errors but was not corrected (when the bypass correction feature is not supported or not enabled), it shall ensure that, for every other 257-bit block within the codeword starting with the first (1st, 3rd, 5th, etc.), ..." It is not possible that the error indication function has "no effect" and "ensures" at the same time.

SuggestedRemedy

Change sentence starting on line 23 to: "When the decoder determines that a codeword contains errors (when the bypass correction feature and the error indication function are enabled) or contains errors but was not corrected (when the bypass correction feature is not supported or not enabled), for every other 257-bit block within the codeword starting with the first (1st, 3rd, 5th, etc.), the synchronization header for the first 66-bit block at the output of the 256B/257B to 64B/66B transcoder, rx_coded_0<1:0>, is set to 11."

Proposed Response *Response Status* **W**
