Comment Type ER Comment Status A Editorial	Comment Type E Comment Status A Manageme				
In general, for amended clauses, only the text of subclauses that are being changed are included. Understanding that for Clause 33, the Task Force has decided to replace the whole Clause, this does not apply to other amended clauses.	Adding 30.12.2.1.18a, 30.12.2.1.18b, 30.12.2.1.18c, 30.12.2.1.18d means that Table 30-7 should be modified with new rows. Similarly for 30.12.3.1.18a, 30.12.3.1.18b, 30.12.3.1.18c, 30.12.3.1.18d SuggestedRemedy				
SuggestedRemedy	Show additions to Table 30-7 for new subclauses.				
In preperation for a request to proceed Working Group Ballot, go through the entire draft and for all amended clauses (except Clause 33) and remove all subclauses that are not being changed. For Clause 25 this involves:	Response Response Status C ACCEPT.				
Leave heading for 25.4 but remove text Remove heading and content for 25.4.1 through 25.4.4	Where is Table 30-7. I don't see it in our draft.				
Change editing instruction to: "Change text of 25.4.5 as follows:" (we do not use the term "section")					
Remove heading and content for 25.4.5.1 through 25.4.6 Below heading for 25.4.7 add editing instruction: "Change text of 25.4.7 as follows:"	Lennart to follow up				
Remove heading and content for 25.4.5.1 through to the ned of the clause.	Cl 33 SC 33.2.8 P 102 L 32 # 4

PSF Inrush

C/ 33	SC 33.2.8.5	P 109	L <b>20</b>	# 28
Darshan, Y	air	Microsemi		

Comment Type TR Comment Status A

In the following text, it is not clear when the PSE is following the template:

"The PSE shall limit IInrush-2P and IInrush during POWER\_UP per the requirements of Table 33-17. The maximum inrush current sourced by the PSE per pairset shall not exceed the per pairset inrush template in Figure 33-26 and Equation (33-13)."

in Figure 33-26 and Equation (33-13) some PD implementations start to show linrush only after significant time (10-30msec) after the application of Vpd but still within Tinrus\_min time duration but the template in figure 33-26 looks that it is relevant to iinrush appearance at t=0 only.

# SuggestedRemedy

Change from:

"The PSE shall limit IInrush-2P and IInrush during POWER\_UP per the requirements of Table 33-17. The maximum inrush current sourced by the PSE per pairset shall not exceed the per pairset inrush template in Figure 33-26 and Equation (33-13)."

## to:

"The PSE shall limit IInrush-2P and IInrush during POWER\_UP \*\*state\*\* per the requirements of Table 33-17. The maximum inrush current sourced by the PSE per pairset shall not exceed the per pairset inrush template in Figure 33-26 and Equation (33-13) \*\*for the duration of POWER\_UP state\*\*."

Darshan, Ya	iir	Microsem	ni	

#### Comment Type TR Comment Status A

1. Table 33-17 item 7 approved baseline additional information column was implemented incorrectly.

2. Some adjustment to linrush for dual-signature PD class 0-4 is required to address worst case operating conditions when PD using constant power sink that operates at minimum Von. Same applies to Table 33-28.

3. Some adjustments are required to clause 33.2.8.5.1 due to (2) + fixing PD type error.

#### SuggestedRemedy

Pres: Darshan1

Addressing comments # 179 and others related to this clause as elaborated below from D1.6:

The following proposed modifications are addressing the following questions:

Comment Status A

1.Does PDs that are internally limiting their inrush current are required to end Inrush period within TInrush-2P min per Table 33-17?

2.How we prevent that PD internal load during linrush period is less than Inrush current setting value to ensure successful POWER\_UP?

3.Adding a note that explains why the PD PI current is not equal to the DC load current during POWER UP.

4.Adding text that addresses the new 110uF value for dual-signature class 1-4.

## SuggestedRemedy

See darshan\_02\_0516.pdf for proposed remedy.

Response Response Status C

Comment Type       T       Comment Status       A       Pres: John         This commment is a recommendation to separate concepts of extended power to class and class 8 PDs and associated requirements to meet *PSE* output power rather than *PD* input power requirements from other more general and more widely applicable PD requirements. We also need to better qualify the cases where Class 6 and Class 8 PD are not subject to Pclass_PD and Ppeak_PD limits.       Rationale is that extended power will be applicable only in specialized systems that are engineered to allow certain PD's to operate above Pclass_PD and interoperate with standard compliant PSE's.         SuggestedRemedy       Create new sub-sections 33.7.2.1 and 33.3.7.4.1.         Re-locate Class 6 / Class 8 extended power text, formulas, and current templates into those respective sections.         I will separately provide a document (baseline text) showing what this would look like in johnson_01_0516_Extended_Pwr_baseline_v1.docx.         Response       Response Status       C	Image: Definition of the maximum like the set of the maximum like the set of th

Variable parameter_type is used in legacy text to indicate the PSE type powering the system so that the electrical parameters (ILIM) may be set based on the PSE Type. The value of parameter_type is not a constant (p61, L53) and is determined by mutual identification of the PSE and PD. The function set_parameter_type is used to set the electrical values based on table values. New Types have these same parameters (ILIM) set based on class rather than Type. The Type 3 and 4 state diagrams (SDs) do not facilitate setting parameters based on class or Type. Comment D1.6 #278 turn the Type 3 and 4 parameter_type variable into a constant. The Type 3 and 4 SD do not use this name to perform a purpose.				after r under provid Suggestee Modify "The a	eading standin les deta d <i>Reme</i> e y existir assigne	mainly the g of the P ills on clas dy ng text, d Class is	to permit understanding of t e relevant PSE or PD subse SE classification section ad ssification event response ir the results of the PDs requ e PSE as shown in Table 33	ctions. Comment Type         TR         Comment Status         A           Presentation, schindler_1_0915, provides an over view of this section and the to add new Types to this section. This section was created to prevent a PSE disconnecting a PD by providing requirements for PDs being subject to PSE traces used associated Type with a class, and the PSE Type determinand TLIM limits that the PD need to remain below. New Types support legacy using different ILIM and TLIM values. It would be better to base operational re of ILIM and TLIM based on assigned PD class.           However, since D1.2, when the requirements we first created, the values of ILI changed. Type-3 ILIM moved down from 817 mA to 702 mA. Type-4 moved of 1.162 A to 0.990 A. A rerun of the SPICE simulation for the Type-3 Extended 2,250V ramp shows the time to reach a point where the system current is below has increased from 3.5 ms to 8 ms, which is acceptable. A rerun of the SPICE for the Type-4 PD using a 2,250V ramp shows the time to reach a point use to reach a point where the system current is below its limit has increased from 1.7 ms to 5.7 ms, which is acceptable of the SPICE simulation for the Type-4 Extended PD using a 2,250V ramp show

Comment Status D

"A Type 1 and Type 2 PSE: - shall not remove power from the PI when I Port is greater than or equal to I Hold-2P max continuously for at least T MPS every T MPS + T MPDO. as defined in Table 33-17."

"A Type 3 or Type 4 PSE, when connected to a single-signature PD: -shall not remove power from the PI when DC MPS has been present within the T MPS + T MPDO window. This allows a PD to minimize its power consumption."

"A Type 3 or Type 4 PSE, when connected to a dual-signature PD: -- shall not remove power from a pairset when DC MPS has been present on both pairsets every T MPS + T MPDO ."

These shalls are essentially meaningless. PSEs may remove power for any reason. The PSE shall remove power in the case of overcurrent, or Vport-2P being out of spec.

This is to protect against bad MPS implementations that remove power when they shouln`t.

#### SuggestedRemedy

Comment Type T

Add a condition 'unless there is a non-MPS related reason to do so':

"A Type 1 and Type 2 PSE: - shall not remove power from the PI, unless there is a non-MPS related reason to do so, when I Port is greater than or equal to I Hold-2P max continuously for at least T MPS every T MPS + T MPDO, as defined in Table 33-17." (Note: merge the above with the other comment that touches this if adopted).

"A Type 3 or Type 4 PSE, when connected to a single-signature PD: -shall not remove power from the PI, unless there is a non-MPS related reason to do so, when DC MPS has been present within the T MPS + T MPDO window. This allows a PD to minimize its power consumption."

"A Type 3 or Type 4 PSE, when connected to a dual-signature PD: -- shall not remove power from a pairset, unless there is a non-MPS related reason to do so, when DC MPS has been present on both pairsets every T MPS + T MPDO ."

Proposed Response Response Status Z REJECT.

This comment was WITHDRAWN by the commenter.

I understand the idea, but the wording is terrible. Also, .3at did not include this language, do we need to?

How about, "...shall not remove power due to MPS absence when..."

Such a PD should increase its IPort min or make other such provisions to meet the Maintain Power Signature."         PD MPS				
SuggestedRemedy Adopt yseboodt_03_0516_pdsig.pdf Response Response Status C ACCEPT IN PRINCIPLE. Adopt yseboodt_03_0516_pdsig.pdf (v130)					We also need to mention IPort-MPS-2P for dual-signature PDs. SuggestedRemedy "NOTEPDs may not be able to meet the IPort_MPS or Iport_MPS-2P specification in Table 33-29 during the maximum allowed port voltage droop (VPort_PSE max to VPort_PSE min with series resistance RCh). Such a PD should increase its IPort min or make other such provisions to meet the Maintain Power Signature."				
TFTD CI 33 S Yseboodt, Lenr	C 33.3.4	P 131 Philips	L 9	# 251	Response Response Status C ACCEPT IN PRINCIPLE. Implement suggested remedy but change Vport_PSE to Vport_PSE-2P.
