30.9 Management for DTE Power via MDI

Editor's Note: 30.9 through 30.12 is included for the convenience of the reader and shall be removed prior to sponsor ballot.

30.9.1 PSE managed object class

This subclause formally defines the behaviours for the oPSE managed object class attributes and actions.

30.9.1.1 PSE attributes

30.9.1.1.1 aPSEID

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

The value of aPSEID is assigned so as to uniquely identify a PSE among the subordinate managed objects of the containing object.;

| *Change 30.9.1.1.2 through 30.9.1.1.11 as follows:*

30.9.1.1.2 aPSEAdminState

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED VALUE that has one of the following entries:

enabled	PSE functions enabled
disabled	PSE functions disabled

BEHAVIOUR DEFINED AS:

A read-only value that identifies the operational state of the PSE functions. An interface which can provide the PSE functions specified in Clause 33 will be enabled to do so when this attribute has the enumeration “enabled.” When this attribute has the enumeration “disabled” the interface will act as it would if it had no PSE function. The operational state of the PSE function can be changed using the acPSEAdminControl action. ~~If a Clause 22 MII or Clause 35 GMII is present, then this will map to the PSE Enable bit specified in 33.5.1.1.6.~~

30.9.1.1.3 aPSEPowerPairsControlAbility

ATTRIBUTE

APPROPRIATE SYNTAX:

BOOLEAN

BEHAVIOUR DEFINED AS:

Indicates the ability to control which PSE Pinout Alternative (see 33.2.4) is used for PD detection and power. When “true” the PSE Pinout Alternative used can be controlled through the aPSEPowerPairs attribute. When “false” the PSE Pinout Alternative used cannot be controlled through the aPSEPowerPairs attribute. ~~If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Pair Control Ability bit specified in 33.5.1.2.12.~~

30.9.1.1.4 aPSEPowerPairs

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED VALUE that has one of the following entries:

signal	PSE Pinout Alternative A
spare	PSE Pinout Alternative B
<u>both</u>	<u>PSE Pinout Alternative A and Alternative B</u>

BEHAVIOUR DEFINED AS:

A read-write value that identifies the supported PSE Pinout Alternative specified in 33.2.4. A GET

operation returns the PSE Pinout Alternative in use. A SET operation changes the PSE Pinout Alternative used to the indicated value only if the attribute aSectionSESThreshold is “true.” If the attribute aPSEPowerPairsControlAbility is “true” a SET operation will cause the PSE functions to be disabled, the PSE Pinout Alternative used to be changed to the value indicated if supported, and then the PSE functions to be enabled. If the attribute aPSEPowerPairsControlAbility is “false” a SET operation has no effect.

The enumeration “signal” indicates that PSE Pinout Alternative A is used for PD detection and power. The enumeration “spare” indicates that PSE Pinout Alternative B is used for PD detection and power. The enumeration “both” indicates that the PSE Pinout uses both Alternative A and Alternative B for detection and power. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Pair Control bits specified in 33.5.1.1.5.;

30.9.1.1.5 aPSEPowerDetectionStatus

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED VALUE that has one of the following entries:

disabled	PSE disabled
searching	PSE searching
deliveringPower	PSE delivering power
test	PSE test mode
fault	PSE fault detected
otherFault	PSE implementation specific fault detected

BEHAVIOUR DEFINED AS:

A read-only value that indicates the current status of the PD Detection function specified in 33.2.6.

The enumeration “disabled” indicates that the PSE State diagram (Figure 33–13) is in the state DISABLED. The enumeration “deliveringPower” indicates that the PSE State diagram is in the state POWER_ON. The enumeration “test” indicates that the PSE State diagram is in the state TEST_MODE. The enumeration “fault” indicates that the PSE State diagram is in the state TEST_ERROR. The enumeration “otherFault” indicates that the PSE State diagram is in the state IDLE due to the variable error_condition = true. The enumeration “searching” indicates the PSE State diagram is in a state other than those listed above. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the PSE Status bits specified in 33.5.1.2.11.;

NOTE—A derivative attribute may wish to apply a delay to the use of the “deliveringPower” enumeration as the PSE state diagram will enter then quickly exit the POWER_ON state if a short-circuit or overcurrent condition is present when power is first applied.;

30.9.1.1.6 aPSEPowerClassification

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED VALUE that has one of the following entries:

class0	Class 0 PD
class1	Class 1 PD
class2	Class 2 PD
class3	Class 3 PD
class4	Class 4 PD
class5	Class 5 PD
class6	Class 6 PD
class7	Class 7 PD

class8 Class 8 PD 1
2

BEHAVIOUR DEFINED AS:

A read-only value that indicates the PD Class of a detected PD as specified in 33.2.7.1.

This value is only valid while a PD is being powered, that is the attribute aLineSESThreshold
aPSEPowerPairsControlAbility reporting the enumeration “deliveringPower”. If a Clause 22 MII
or Clause 35 GMII is present, then this will map to the PD Class bits specified in 33.5.1.2.10.;

30.9.1.1.7 aPSEInvalidSignatureCounter

ATTRIBUTE

APPROPRIATE SYNTAX:

Generalized nonresettable counter. This counter has a maximum increment rate of 2 counts per second.

BEHAVIOUR DEFINED AS:

This counter is incremented when the PSE state diagram (Figure 33–13) enters the state SIGNATURE_INVALID. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Invalid Signature bit specified in 33.5.1.2.6.;

30.9.1.1.8 aPSEPowerDeniedCounter

ATTRIBUTE

APPROPRIATE SYNTAX:

Generalized nonresettable counter. This counter has a maximum increment rate of 2 counts per second.

BEHAVIOUR DEFINED AS:

This counter is incremented when the PSE state diagram (Figure 33–13) enters the state POWER_DENIED. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Power Denied bit specified in 33.5.1.2.4.;

30.9.1.1.9 aPSEOVerLoadCounter

ATTRIBUTE

APPROPRIATE SYNTAX:

Generalized nonresettable counter. This counter has a maximum increment rate of 2 counts per second.

BEHAVIOUR DEFINED AS:

This counter is incremented when the PSE state diagram (Figure 33–13) enters the state ERROR_DELAY_OVER. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Overload bit specified in 33.5.1.2.8.;

30.9.1.1.10 aPSEShortCounter

ATTRIBUTE

APPROPRIATE SYNTAX:

Generalized nonresettable counter. This counter has a maximum increment rate of 2 counts per second.

BEHAVIOUR DEFINED AS:

This counter is incremented when the PSE state diagram (Figure 33–13) enters the state

1 ERROR_DELAY_SHORT. If a Clause 22 MII or Clause 35 GMII is present, then this will map to—
2 the Short Circuit bit specified in 33.5.1.2.7.;

30.9.1.1.11 aPSEMPSAbsentCounter

4 ATTRIBUTE

5 APPROPRIATE SYNTAX:

6 Generalized nonresettable counter. This counter has a maximum increment rate of 2 counts per
7 second.

8 BEHAVIOUR DEFINED AS:

9 This counter is incremented when the PSE state diagram (Figure 33–13) transitions directly from
10 the state POWER_ON to the state IDLE due to tmpdo_timer_done being asserted. If a Clause 22
11 MII or Clause 35 GMII is present, then this will map to the MPS_Absent bit specified in 33.5.1.2.7.;

30.9.1.1.12 aPSEActualPower

12 ATTRIBUTE

13 APPROPRIATE SYNTAX:

14 INTEGER

15 BEHAVIOUR DEFINED AS:

16 An integer value indicating present (actual) power being supplied by the PSE as measured at the
17 MDI in milliwatts. The behaviour is undefined if the state of aPSEPowerDetectionStatus is
18 anything other than deliveringPower. The sampling frequency and averaging is vendor-defined.;

30.9.1.1.13 aPSEPowerAccuracy

20 ATTRIBUTE

21 APPROPRIATE SYNTAX:

22 INTEGER

23 BEHAVIOUR DEFINED AS:

24 An integer value indicating the accuracy associated with aPSEActualPower in +/- milliwatts.;

30.9.1.1.14 aPSECumulativeEnergy

27 ATTRIBUTE

28 APPROPRIATE SYNTAX:

29 Generalized nonresettable counter. The counter has a maximum increment rate of 100000 per
30 second.

31 BEHAVIOUR DEFINED AS:

32 A count of the cumulative energy supplied by the PSE as measured at the MDI in millijoules.;

30.9.1.1.15 aPSEPowerPairsx

33 ATTRIBUTE

34 APPROPRIATE SYNTAX:

35 An ENUMERATED VALUE that has one of the following entries:

36 signal PSE Pinout Alternative A

37 spare PSE Pinout Alternative B

38 both PSE Pinout Alternative A and B

39 BEHAVIOUR DEFINED AS:

40 A read-write value that identifies the supported PSE Pinout Alternative specified in 33.2.4. A GET
41 operation returns the PSE Pinout Alternative in use. A SET operation changes the PSE Pinout
42 Alternative used to the indicated value only if the attribute aSectionSESThreshold is “true.” If the
43 value is “false,” the PSE Pinout Alternative is not changed.

attribute aSectionSESThreshold is “false” a SET operation has no effect.
The enumeration “signal” indicates that PSE Pinout Alternative A is used for PD detection and power. The enumeration “spare” indicates that PSE Pinout Alternative B is used for PD detection and power. The enumeration “both” indicates that the PSE Pinout uses both Alternative A and Alternative B for detection and power.;

30.9.1.2 PSE actions	45
30.9.1.2.1 acPSEAdminControl	46
ACTION	49
APPROPRIATE SYNTAX: Same as <u>aSectionStatus</u> - <u>aPSEAdminState</u>	51
BEHAVIOUR DEFINED AS:	53
	54

This action provides a means to alter aSectionStatus-aPSEAdminState. ;	1
30.9.2 PD managed object class	2
This subclause formally defines the behaviours for the oPD managed object class attributes.	3
30.9.2.1 PD attributes	4
30.9.2.1.1 aPDID	5
ATTRIBUTE	6
APPROPRIATE SYNTAX:	7
INTEGER	8
BEHAVIOUR DEFINED AS:	9
The value of aPDID is assigned so as to uniquely identify a PD Power via MDI classification local system among the subordinate managed objects of the containing object.;	10
30.10 Layer management for Midspan	11
30.10.1 Midspan managed object class	12
This subclause formally defines the behaviours for the oMidSpan managed object class, attributes, and notifications.	13
30.10.1.1 Midspan attributes	14
30.10.1.1.1 aMidSpanID	15
ATTRIBUTE	16
APPROPRIATE SYNTAX:	17
INTEGER	18
BEHAVIOUR DEFINED AS:	19
The value of aMidSpanID is assigned so as to uniquely identify a Midspan device among the subordinate managed objects of system (systemID and system are defined in ISO/IEC 10165-2:1992 [SMI]).;	20
30.10.1.1.2 aMidSpanPSEGGroupCapacity	21
ATTRIBUTE	22
APPROPRIATE SYNTAX:	23
INTEGER	24
BEHAVIOUR DEFINED AS:	25
The aMidSpanPSEGGroupCapacity is the number of PSE groups that can be contained within the Midspan device. Within each managed Midspan device, the PSE groups are uniquely numbered in the range from 1 to aMidSpanPSEGGroupCapacity.	26
Some PSE groups may not be present in a given Midspan instance, in which case the actual number of PSE groups present is less than aMidSpanPSEGGroupCapacity. The number of PSE groups present is never greater than aMidSpanPSEGGroupCapacity.;	27

30.10.1.1.3 aMidSpanPSEGroupMap	1
ATTRIBUTE	2
APPROPRIATE SYNTAX:	3
BITSTRING	4
BEHAVIOUR DEFINED AS:	5
A string of bits which reflects the current configuration of PSE groups that are viewed by PSE group managed objects. The length of the bitstring is “aMidSpanPSEGroupCapacity” bits. The first bit relates to PSE group 1. A “1” in the bitstring indicates presence of the PSE group, “0” represents absence of the PSE group.;	6 8 9 10 11 12
30.10.1.2 Midspan notifications	13
30.10.1.2.1 nMidSpanPSEGroupMapChange	14
NOTIFICATION	15
APPROPRIATE SYNTAX:	16
BITSTRING	17
BEHAVIOUR DEFINED AS:	18
This notification is sent when a change occurs in the PSE group structure of a Midspan device. This occurs only when a PSE group is logically removed from or added to a Midspan device. The nMidSpanPSEGroupMapChange notification is not sent when powering up a Midspan device. The value of the notification is the updated value of the aMidSpanPSEGroupMap attribute.;	19 20 21 22 23 24 25 26
30.10.2 PSE Group managed object class	27
This subclause formally defines the behaviours for the oPSEGroup managed object class, attributes, actions, and notifications.	28 29 30
30.10.2.1 PSE Group attributes	31
30.10.2.1.1 aPSEGroupID	32
ATTRIBUTE	33
APPROPRIATE SYNTAX:	34
INTEGER	35
BEHAVIOUR DEFINED AS:	36
A value unique within the Midspan device. The value of aPSEGroupID is assigned so as to uniquely identify a PSE group among the subordinate managed objects of the containing object (oMidSpan). This value is never greater than aMidSpanPSEGroupCapacity.;	37 38 39 40 41 42 43 44
30.10.2.1.2 aPSECapacity	45
ATTRIBUTE	46
APPROPRIATE SYNTAX:	47
INTEGER	48
BEHAVIOUR DEFINED AS:	49
The aPSECapacity is the number of PSEs contained within the PSE group. Valid range is 1 to 1024. Within each PSE group, the PSEs are uniquely numbered in the range from 1 to aPSECapacity. Some PSEs may not be present in a given PSE group instance, in which case the	50 51 52 53 54

30.12.2.1.7 aLIdpXdot3LocPowerMDIEnabled

ATTRIBUTE	1
APPROPRIATE SYNTAX:	2
BOOLEAN	3
BEHAVIOUR DEFINED AS:	4
A read-only Boolean value used to identify whether MDI power is enabled on the given port associated with the local system.;	5
	6
	7
	8
	9
	10

30.12.2.1.8 aLIdpXdot3LocPowerPairControlable

ATTRIBUTE	11
APPROPRIATE SYNTAX:	12
BOOLEAN	13
BEHAVIOUR DEFINED AS:	14
A read-only Boolean value derived from the value of pethPsePortPowerPairsControlAbility object and used to indicate whether the pair selection can be controlled on the given port associated with the local system.;	15
	16
	17
	18
	19
	20
	21

30.12.2.1.9 aLIdpXdot3LocPowerPairs

ATTRIBUTE	22
APPROPRIATE SYNTAX:	23
The same as used for aPSEPowerPairs	24
BEHAVIOUR DEFINED AS:	25
A read-only the value that contains the value of the pethPsePortPowerPairs object which is associated with the given port on the local system.;	26
	27
	28
	29
	30
	31

30.12.2.1.10 aLIdpXdot3LocPowerClass

ATTRIBUTE	32
APPROPRIATE SYNTAX:	33
The same as used for aPSEPowerClassification	34
BEHAVIOUR DEFINED AS:	35
A read-only the value that contains the value of the pethPsePortPowerClassifications object which is associated with the given port on the local system.;	36
	37
	38
	39
	40
	41

30.12.2.1.14 aLIdpXdot3LocPowerType

ATTRIBUTE	42
APPROPRIATE SYNTAX:	43
BIT STRING [SIZE (2)]	44
BEHAVIOUR DEFINED AS:	45
A GET attribute that returns a bit string indicating whether the local system is a PSE or a PD and whether it is Type 1 or Type 2. The first bit indicates Type 1 or Type 2. The second bit indicates PSE or PD. A PSE shall set this bit to indicate a PSE. A PD shall set this bit to indicate a PD.;	46
	47
	48
	49
	50
	51
	52
	53
	54

30.12.2.1.15 aLldpXdot3LocPowerSource

ATTRIBUTE

APPROPRIATE SYNTAX:

BIT STRING [SIZE (2)]

BEHAVIOUR DEFINED AS:

A GET attribute that returns a bit string indicating the power sources of the local system. A PSE indicates whether it is being powered by a primary power source; a backup power source; or unknown. A PD indicates whether it is being powered by a PSE and locally; by a PSE only; or unknown.;

30.12.2.1.16 aLldpXdot3LocPowerPriority

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED value list that has the following entries:

low	low priority PD
high	high priority PD
critical	critical priority PD
unknown	priority unknown

BEHAVIOUR DEFINED AS:

A GET attribute that returns the priority of a PD system. For a PSE, this is the priority that the PSE assigns to the PD. For a PD, this is the priority that the PD requests from the PSE.

A SET operation changes the priority of the PD system to the indicated value.;

30.12.2.1.17 aLldpXdot3LocPDRequestedPowerValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns the PD requested power value. For a PD, it is the power value that the PD has currently requested from the remote system. PD requested power value is the maximum input average power the PD ever draws under this power allocation if accepted. For a PSE, it is the power value that the PSE mirrors back to the remote system. This is the PD requested power value that was used by the PSE to compute the power it has currently allocated to the remote system. The PD requested power value is encoded according to Equation (79-1), where X is the decimal value of aLldpXdot3LocPDRequestedPowerValue.;

30.12.2.1.18 aLldpXdot3LocPSEAllocatedPowerValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns the PSE allocated power value. For a PSE, it is the power value that the PSE has currently allocated to the remote system. The PSE allocated power value is the maximum input average power that the PSE wants the PD to ever draw under this allocation if it is accepted. For a PD, it is the power value that the PD mirrors back to the remote system. This is the PSE allocated power value that was used by the PD to compute the power that it has currently

requested from the remote system. The PSE allocated power value is encoded according to
Equation (79–2), where X is the decimal value of aLldpXdot3LocPSEAllocatedPowerValue.;

1
2
3

NOT PART OF BASELINE:

Items 30.12.2.1.18a to 30.12.2.1.18d moved to the end of this document as they are need to support the new Measurement TLV section.

30.12.2.1.18e aLldpXdot3LocPSEPowerPairsx	1
ATTRIBUTE	2
APPROPRIATE SYNTAX:	3
The same as used for aPSEPowerPairsx	4
BEHAVIOUR DEFINED AS:	5
A read-only the value that contains the value for the PSE on the local system.;	6
	7
	9
	10
	13
	14
30.12.2.1.18f aLldpXdot3LocPDLoad	15
ATTRIBUTE	16
APPROPRIATE SYNTAX:	17
BOOLEAN	18
BEHAVIOUR DEFINED AS:	19
A read-only Boolean value use to indicate the load configuration of a dual-signature PD on the local system.;	20
	21
	22
	23
	24
30.12.2.1.18g aLldpXdot3LocPDModeSelection	25
ATTRIBUTE	26
APPROPRIATE SYNTAX:	27
BOOLEAN	28
BEHAVIOUR DEFINED AS:	29
A read-only attribute that returns if an ongoing power negotiation applies to Mode A or Mode B for a dual-signature PD.;	30
	31
	32
	33
	34
	35
	36
30.12.2.1.18h aLldpXdot3LocPowerClassx	37
ATTRIBUTE	38
APPROPRIATE SYNTAX:	39
An ENUMERATED VALUE that has one of the following entries:	40
pClassPSE PSE	41
pClassPD PD	
BEHAVIOUR DEFINED AS:	
A read-only value that identifies the port Class of the given port associated with the local system.;	45
	46
	47
30.12.2.1.18i aLldpXdot3LocPowerTypex	48
ATTRIBUTE	
APPROPRIATE SYNTAX:	
BIT STRING [SIZE (4)]	
BEHAVIOUR DEFINED AS:	
A read-only attribute that returns a bit string indicating whether the local system is a PSE or a PD and Copyright © 2016 IEEE. All rights reserved.	

whether it is Type 1 to 4. The most significant first three bits indicates theType. The least significant bit indicates PSE or PD. A PSE shall set this bit to indicate a PSE. A PD shall set this bit to indicate a PD.;	51
	52
	53
	54

BEHAVIOUR DEFINED AS:	1
A GET attribute that returns the Type of the PSE or PD, and if the device is a PSE or PD.;	2
30.12.2.1.18j aLldpXdot3Loc4PD4PID	3
	4

BEHAVIOUR DEFINED AS:
A GET attribute that returns an index of the price of power.;

30.12.2.1.21 aLldpXdot3LocReducedOperationPowerValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns the reduced operation power value. For a PD, it is a power value that is lower than the currently requested power value. This reduced operation power value represents a power state in which the PD could continue to operate, but with less functionality than at the current PD requested power value. The PSE could optionally use this information in the event that the PSE subsequently requests a lower PD power value than the PD requested power value. For a PSE, it is a power value that the PSE could ask the PD to move to if the PSE wants the PD to move to a lower power state. The definition and encoding of PD requested power value is the same as described in aLLdpXdot3LocPDRequestedPowerValue (30.12.2.1.17). The default value for this field is the hexadecimal value FFFF;.

COMMENT NOT PART OF BASELINE:

Where did this value come from? This is not in clause 33.

30.12.3 LLDP Remote System Group managed object class

This subclause formally defines the behaviours for the oLldpXdot3RemSystemsGroup managed object class attributes.

30.12.3.1.5 aLldpXdot3RemPowerPortClass

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED VALUE that has one of the following entries:

pClassPSE PSE
pClassPD PD

BEHAVIOUR DEFINED AS:

A read-only value that identifies the port Class of the given port associated with the remote system.;

30.12.3.1.6 aLldpXdot3RemPowerMDISupported

ATTRIBUTE

APPROPRIATE SYNTAX:

BOOLEAN

BEHAVIOUR DEFINED AS:

A read-only Boolean value used to indicate whether the MDI power is supported on the given port associated with the remote system.;

30.12.3.1.7 aLldpXdot3RemPowerMDIEnabled

ATTRIBUTE

APPROPRIATE SYNTAX:

BOOLEAN

BEHAVIOUR DEFINED AS:

53
54

A read-only Boolean value used to identify whether MDI power is enabled on the given port associated with the remote system.;	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54
30.12.3.1.8 aLldpXdot3RemPowerPairControlable	
ATTRIBUTE	
APPROPRIATE SYNTAX:	
BOOLEAN	
BEHAVIOUR DEFINED AS:	
A read-only Boolean value is derived from the value of pethPsePortPowerPairsControlAbility object and is used to indicate whether the pair selection can be controlled on the given port associated with the remote system.;	
30.12.3.1.9 aLldpXdot3RemPowerPairs	
ATTRIBUTE	
APPROPRIATE SYNTAX:	
The same as used for aPSEPowerPairs	
BEHAVIOUR DEFINED AS:	
A read-only the value that contains the value of the pethPsePortPowerPairs object which is associated with the given port on the remote system.;	
30.12.3.1.10 aLldpXdot3RemPowerClass	
ATTRIBUTE	
APPROPRIATE SYNTAX:	
The same as used for aPSEPowerClassification	
BEHAVIOUR DEFINED AS:	
A read-only the value that contains the value of the pethPsePortPowerClassifications object which is associated with the given port on the remote system.;	
30.12.3.1.14 aLldpXdot3RemPowerType	
ATTRIBUTE	
APPROPRIATE SYNTAX:	
BIT STRING [SIZE (2)]	
BEHAVIOUR DEFINED AS:	
A GET attribute that returns a bit string indicating whether the remote system is a PSE or a PD and whether it is Type 1 or Type 2. The first bit indicates Type 1 or Type 2. The second bit indicates PSE or PD.;	
30.12.3.1.15 aLldpXdot3RemPowerSource	
ATTRIBUTE	
APPROPRIATE SYNTAX:	
BIT STRING [SIZE (2)]	
BEHAVIOUR DEFINED AS:	
A GET attribute that returns a bit string indicating the power sources of the remote system. When the remote system is a PSE, it indicates whether it is being powered by a primary power source; a	

backup power source; or unknown. When the remote system is a PD, it indicates whether it is being
powered by a PSE and locally; locally only; by a PSE only; or unknown.;

30.12.3.1.16 aLldpXdot3RemPowerPriority

ATTRIBUTE

APPROPRIATE SYNTAX:

An ENUMERATED value list that has the following entries:

low	low priority PD
high	high priority PD
critical	critical priority PD
unknown	priority unknown

BEHAVIOUR DEFINED AS:

A GET operation returns the priority of the PD system received from the remote system. For a
PSE, this is the priority that the remote system requests from the PSE. For a PD, this is the priority
that the remote system has assigned to the PD.;

30.12.3.1.17 aLldpXdot3RemPDRequestedPowerValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns the PD requested power value that was used by the remote system to
compute the power value that is has currently allocated to the PD. For a PSE, it is the PD requested
power value received from the remote system. The definition and encoding of PD requested power
value is the same as described in aLldpXdot3LocPDRequestedPowerValue (30.12.2.1.17).;

30.12.3.1.18 aLldpXdot3RemPSEAllocatedPowerValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns the PSE allocated power value received from the remote system. For
a PSE, it is the PSE allocated power value that was used by the remote system to compute the
power value that it has currently requested from the PSE. For a PD, it is the PSE allocated power
value received from the remote system. The definition and encoding of PSE allocated power value
is the same as described in aLldpXdot3LocPSEAllocatedPowerValue (30.12.2.1.18).;

NOT PART OF BASELINE:

Items 30.12.2.1.18a to 30.12.2.1.18d moved to the end of this document as they will need to be created to support the new Measurement LLDP section.

30.12.3.1.18e aLldpXdot3RemPowerPairsx	35
ATTRIBUTE	36

NOT PART OF THE BASELINE:

Additional BASELINE to fix Management issues: Provide Editor with the permission to locate this section correctly.

IEEE Clause 30 and 79 text references RFC 3621 as the definition, which is no longer correct. IEEE Std 802.3.1-2013 states in Clause 1 'Overview' that 'This document supersedes and makes obsolete ... IETF RFC 3621 ...'.

SOLUTION

Clause 30 changes have removed references to RFC 3621.

Page 219 existing text,

"The PSE power pair field shall contain an integer value as defined by the pethPsePortPowerPairs object in IETF RFC 3621."

shall be replaced by adding to clause 79 as of a result of a TDL assigned to Fred Schindler and additions to clause 30 as of a result of a TDL assigned to David Law.

==== RFC 3621 text likely to be used:

```
pethPsePortPowerPairsControlAbility OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-only
STATUS current

DESCRIPTION
"Describes the capability of controlling the power pairs
functionality to switch pins for sourcing power.
The value true indicate that the device has the capability
to control the power pairs. When false the PSE Pinout
Alternative used cannot be controlled through the
PethPsePortAdminEnable attribute."
REFERENCE
"IEEE Std 802.3af Section 30.9.1.1.3
aPSEPowerPairsControlAbility"
::= { pethPsePortEntry 4 }
pethPsePortPowerPairs OBJECT-TYPE
SYNTAX INTEGER {
signal(1),
spare(2)
}
MAX-ACCESS read-write
STATUS current
DESCRIPTION
"Describes or controls the pairs in use. If the value of
pethPsePortPowerPairsControl is true, this object is
writable.
A value of signal(1) means that the signal pairs
only are in use.
A value of spare(2) means that the spare pairs
only are in use."
REFERENCE
"IEEE Std 802.3af Section 30.9.1.1.4 aPSEPowerPairs"
::= { pethPsePortEntry 5 }
pethPsePortDetectionStatus OBJECT-TYPE
SYNTAX INTEGER {
disabled(1),
searching(2),
deliveringPower(3),
fault(4),
test(5),
otherFault(6)
}
Berger & Romascanu Standards Track [Page 7]
RFC 3621 Power Ethernet MIB December 2003
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"Describes the operational status of the port PD detection.
A value of disabled(1)- indicates that the PSE State diagram
is in the state DISABLED.
A value of deliveringPower(3) - indicates that the PSE State
diagram is in the state POWER_ON for a duration greater than
tlim max (see IEEE Std 802.3af Table 33-5 tlim).
```

A value of fault(4) - indicates that the PSE State diagram is in the state TEST_ERROR.

A value of test(5) - indicates that the PSE State diagram is in the state TEST_MODE.

A value of otherFault(6) - indicates that the PSE State diagram is in the state IDLE due to the variable error_conditions.

A value of searching(2)- indicates the PSE State diagram is in a state other than those listed above."

::= { pethPsePortEntry 6 }

pethPsePortPowerPriority OBJECT-TYPE

SYNTAX INTEGER {

critical(1),

high(2),

low(3)

}

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"This object controls the priority of the port from the point of view of a power management algorithm. The priority that is set by this variable could be used by a control mechanism that prevents over current situations by disconnecting first ports with lower power priority. Ports that connect devices critical to the operation of the network - like the E911 telephones ports - should be set to higher priority."

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns PSE measured voltage value. For a PSE, it is the measured voltage value that the PSE has currently measured and sent to the remote system. PSE measured voltage value is the voltage measured at its PI. The PSE measured voltage value is encoded according to Table 79–7g, where X is the decimal value of aLldpXdot3LocPSEMeasuredVoltageValue.;

30.12.2.1.18d aLldpXdot3LocPSEMeasuredCurrentValue

ATTRIBUTE

APPROPRIATE SYNTAX:

INTEGER

BEHAVIOUR DEFINED AS:

A GET attribute that returns PSE measured current value. For a PSE, it is the measured current value that the PSE has currently measured and sent to the remote system. PSE measured current value is the current measured at its PI. The PSE measured current value is encoded according to Table 79–7g, where X is the decimal value of aLldpXdot3LocPSEMeasuredCurrentValue.;

| ***Insert 30.12.3.1.18a through 30.12.3.1.18g after 30.12.2.1.18 as follows:***

30.12.3.1.18a aLldpXdot3RemPDMeasuredVoltageValue

ATTRIBUTE

46

APPROPRIATE SYNTAX:

47

INTEGER

48

BEHAVIOUR DEFINED AS:

49

A GET attribute that returns PD measured voltage received from the remote system by a PSE. The definition and encoding of PD measured voltage value is the same as described in

50

51
