Agenda

- Background
- Samples and Measurement Setup
- Measurement Results of Transfer Function
- Measurement Result of EAF at TP2
- MPD at TP2 Lower Bound Limit Proposal

Background

No sample met the transfer function lower bound limit under the launch condition close to that specified in 802.3bv/D1.3 and D1.4 in our measurement

Need to verify EAF and transfer function with actual FOTs

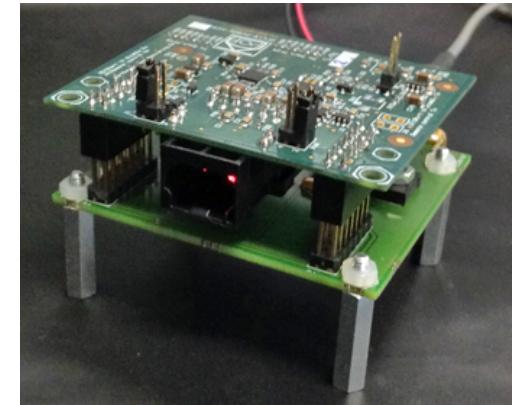

Samples

➤ POF

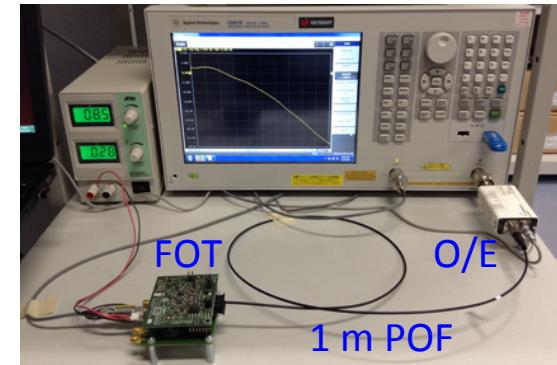

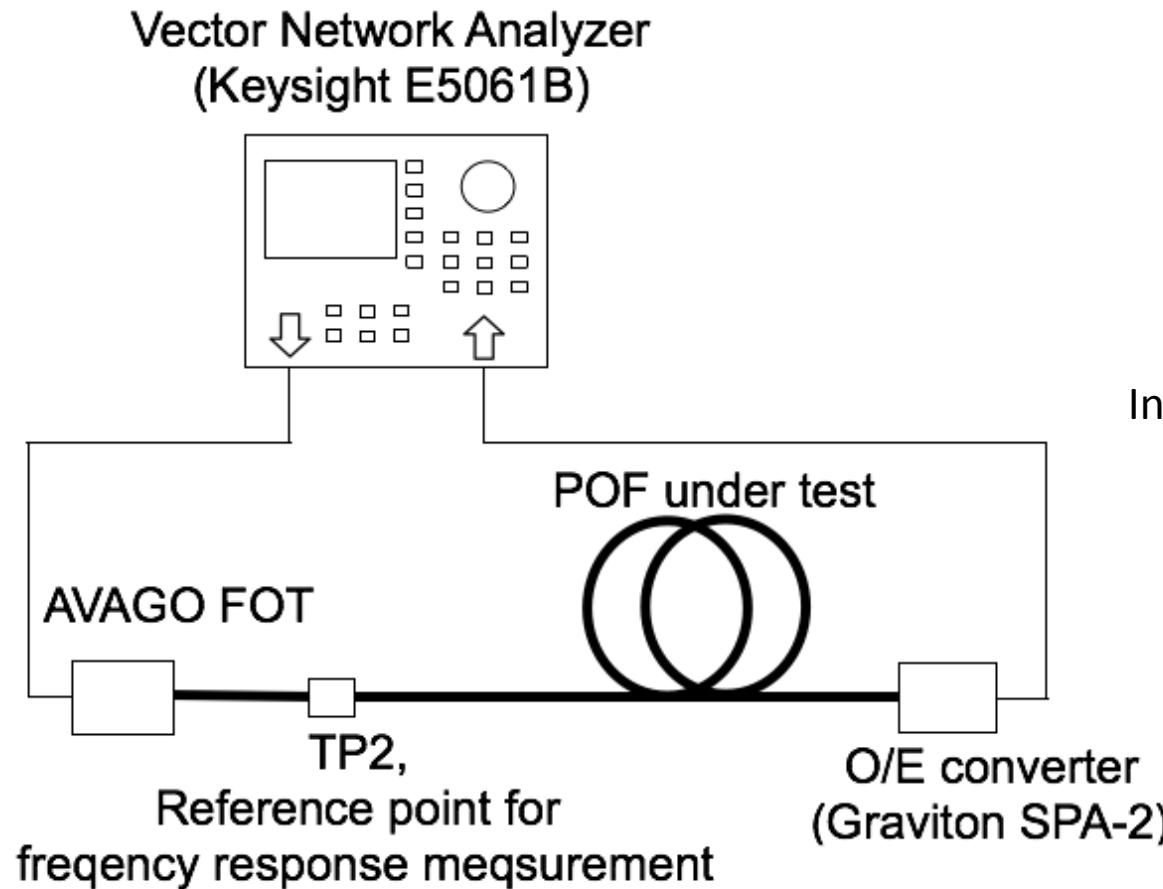

- Subcategory A4a.2 (NA = 0.485 +/- 0.045)
- 3 manufacturers, one product from each
- 3 samples for Product A
- One sample for Product B and C

➤ FOT

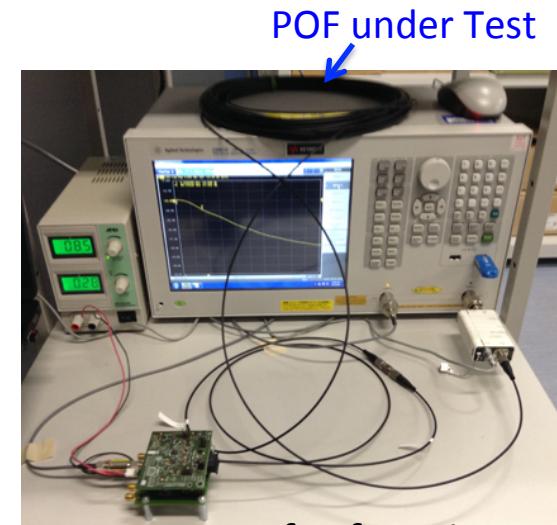

- 3 FiberDock samples
(#2, #4, #6)

Measurement Setup – Transfer Function

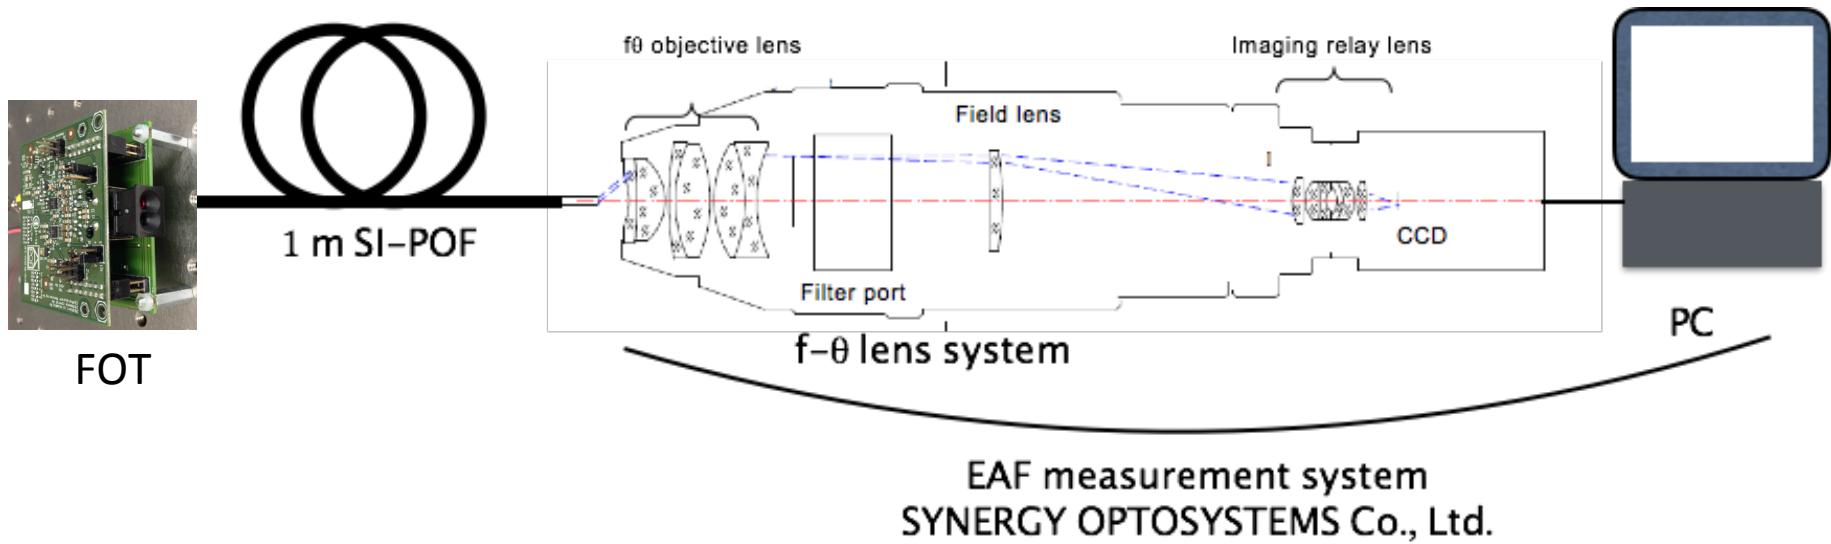

Instrumental function measurement

POF transfer function
measurement

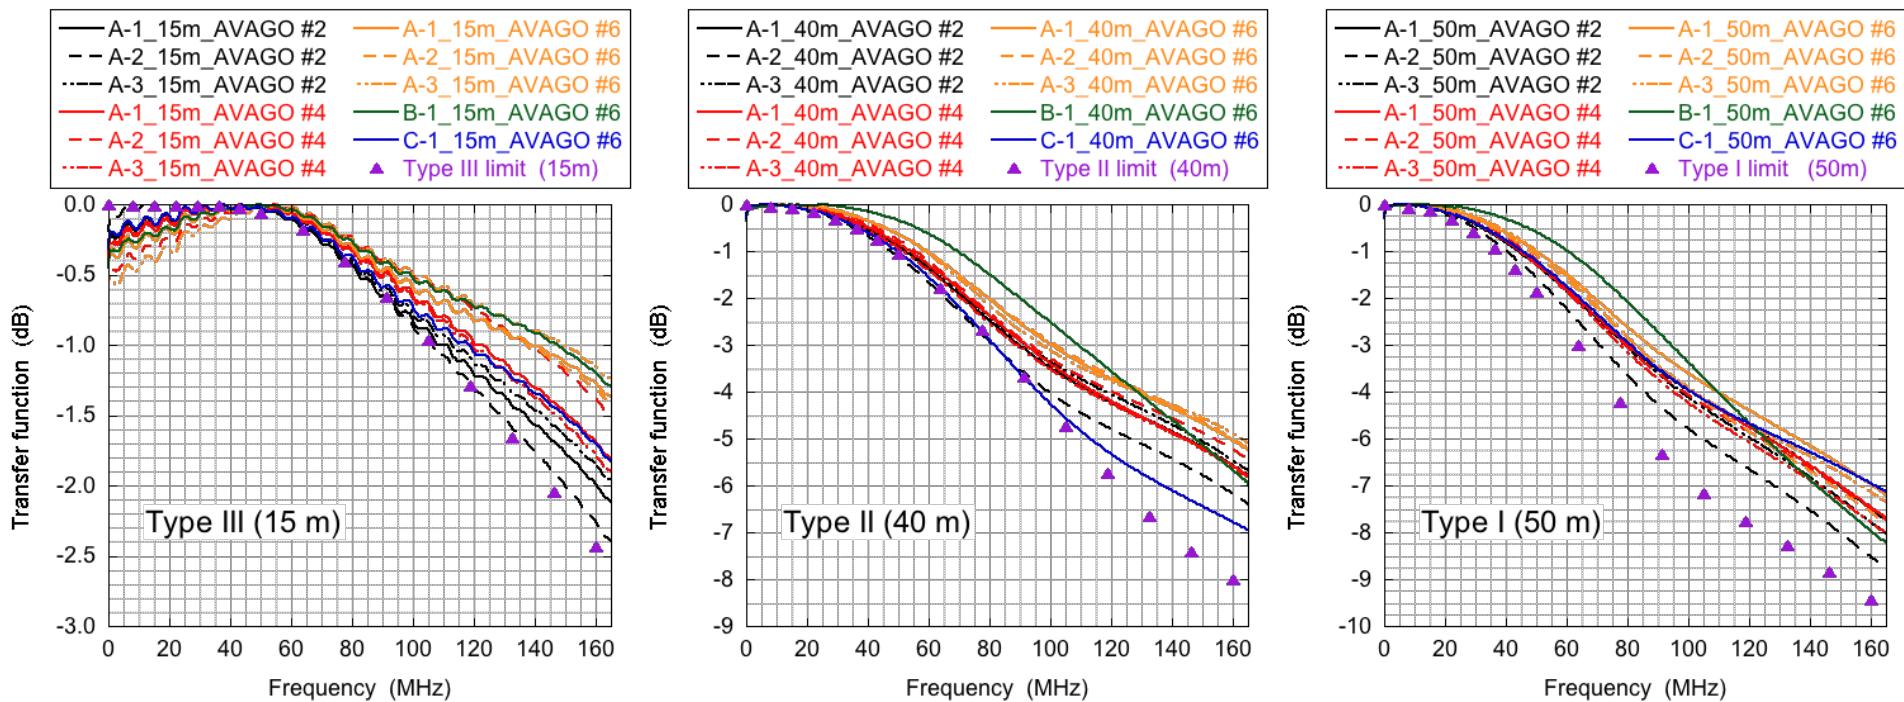

Measurement Setup – Encircled Angular Flux

The EAF measurement system is in conformity with IEC 61300-3-53

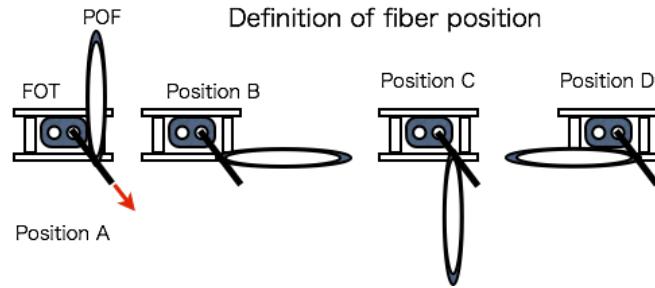

Measurement Result of POF Transfer Function

All the POF samples fulfilled
the transfer function lower bound limits

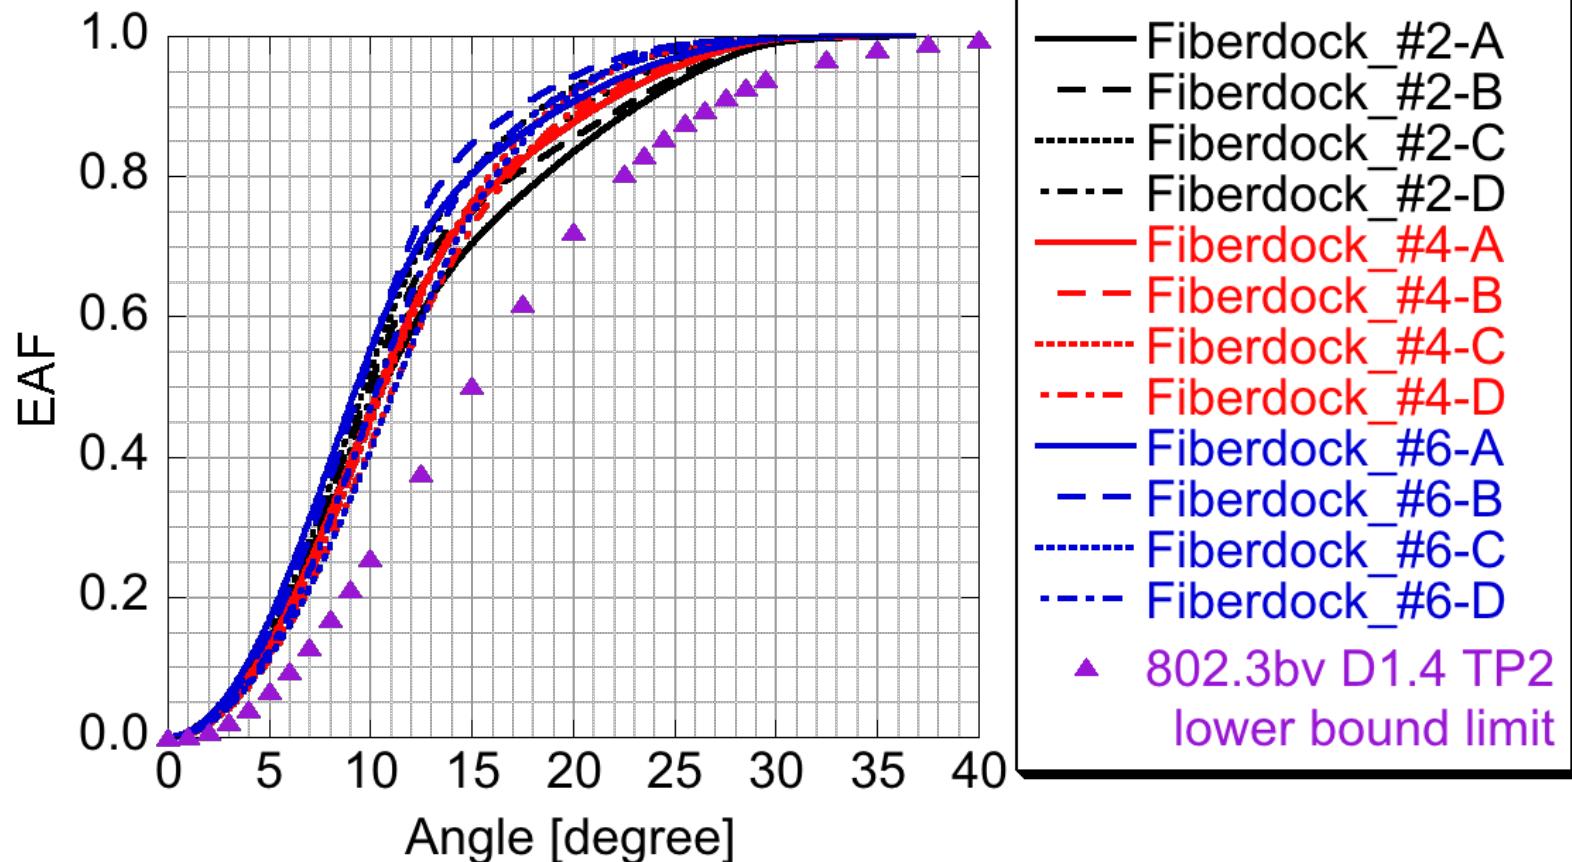

Data in low frequency area of Type III are unreasonable. The cause is not clear at the moment.

Measurement Result of EAF at TP2

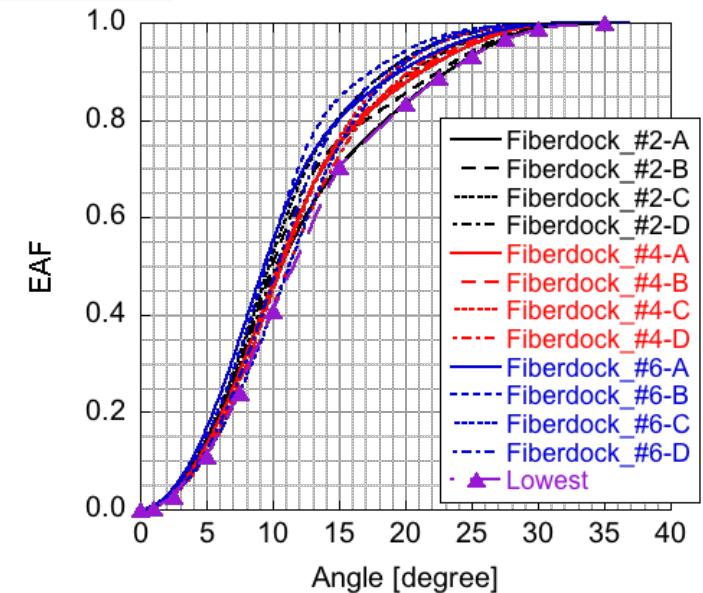

All samples showed mode distribution much lower than the EAF template in 802.3bv/D1.4

Lowest values at every angles are picked up to draw up the EAF lower bound limit

Angle (degree)	Fiberdock #2-A	Fiberdock #2-B	Fiberdock #2-C	Fiberdock #2-D	Fiberdock #4-A	Fiberdock #4-B	Fiberdock #4-C	Fiberdock #4-D	Fiberdock #6-A	Fiberdock #6-B	Fiberdock #6-C	Fiberdock #6-D
