 On page 110 line 24 we have a definition of ldpc_two_frame_done as the point aligned to the inversion on pair A during PMA training.
 However on page 99 line 49 and page 124 line 7 the term "even LDPC frame boundary" is used. Is this precise enough to avoid ambiguity?
 SuggestedRemedy
 page 99 line 49
 change "If the sleep signal begins on an even LDPC frame boundary,"
 to "If the sleep signal begins on an even LDPC frame boundary aligned to the inversion on pair A during PMA training,"
 page 124 line 7
 change "The link failure signal is sent for 8 LDPC frames and begins on an even LDPC frame boundary."
 to "The link failure signal is sent for 8 LDPC frames and begins on an even LDPC frame boundary aligned to the inversion on pair A during PMA training."

 Figure 126-7 note is incorrect: "Note -- Conversion from 4DPAM-16 symbols occurs in the
 LDPC decoding process. Additionally,
 bits 1724 through 1820 were replaced with zeros in rx_4D-PAM16<107> through
 rx_4D-PAM16<113> during the LDPC encoding process."
 Prior to the encoding process, 97 zeros are appended to the aux bit and block of 1625 bits
 to get 1723 bits. The encoder adds 325 bits.
 rx_4D-PAM16 is symbol based and doesn't have bits.
 SuggestedRemedy
 Replace note
 ("Note -- Conversion from 4DPAM-16 symbols occurs in the LDPC decoding process.
 Additionally,
 bits 1724 through 1820 were replaced with zeros in rx_4D-PAM16<107 through rx_4D-
 PAM16<113> during the LDPC encoding process.")
 with:
 ""Note - Conversion from 4DPAM-16 symbols to bits occurs in the LDPC decoder."

Comment Type E Comment Status D Editorial

Comment i-83 stated:
 "aRO = Read only, LH = Latching high" - Table 45-124 does not contain "LH" designator right now
 This is not a correct statement. The rows of the table that have been reproduced in the P802.3bz draft do not contain LH, but a row that has not been included in the draft does. Comment i-83 should have been rejected. Footnote a in Table 45-124 is "RO = Read only, LH = Latching high" and should be shown as such. Choosing not to show the part of the table containing the "LH" is not a reason to change the footnote.

SuggestedRemedy

Reinstate the correct footnote in all tables that were changed due to comment i-83. This is at least:
 Table 45-7 should be "R/W = Read/Write, RO = Read only"
 Table 45-124 should be "RO = Read only, LH = Latching high"
 Table 45-208 should be "RO = Read only, SC = Self-clearing, LH = Latching high"

CI 46 SC 46.1 P 59 L 13 # r01-14
Marris, Arthur Cadence Design Syst

Comment Type TR Comment Status D XGMII

For 2.5GBASE-T PHYs the link fault signaling state diagram described in 46.3.4 is only necessary to signal link interruption for fast retrain. Seeing as fast retrain is optional, implementation of the link fault signaling should be optional also.
Making link fault signaling optional would allow speeded up SGMII implementations to be used to connect to 2.5GBASE-T PHYs allowing better inter-operability with existing ASIC implementations.

Also the requirement to implement the link fault state machine adds extra complexity to the ASIC attached to the 2.5GBASE-T PHY.

SuggestedRemedy

Add an extra sentence to the end of this paragraph so it reads:
"The 2.5 Gb/s, 5 Gb/s, and 10 Gb/s Physical Coding Sublayers (PCS) are specified to the XGMII, so if not implemented, a conforming implementation shall behave functionally as if the RS and XGMII were implemented. For 2.5 Gb/s and 5 Gb/s data rates implementation of link fault signaling as described in 46.3.4 is optional."

Bring subclause 46.3.4 into 802.3bz and change the last sentence from:
"The RS shall implement the link fault signaling state diagram (see Figure 46-11)."
To:
"The RS shall implement the link fault signaling state diagram (see Figure 46-11) for data rates of 10 Gb/s and above. For 2.5 Gb/s and 5 Gb/s data rates implementation of the link fault signaling state diagram is optional."

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.
Task force to discuss tradeoffs and consider the potential remedy for 2.5Gb/s only. See presentation
http://www.ieee802.org/3/NGEBASET/public/archadhoc/marris_3bzah_1_0616.pdf

Potential remedy text:
Add an extra sentence to the end of this paragraph so it reads:
"The 2.5 Gb/s, 5 Gb/s, and 10 Gb/s Physical Coding Sublayers (PCS) are specified to the XGMII, so if not implemented, a conforming implementation shall behave functionally as if the RS and XGMII were implemented. For the 2.5 Gb/s data rate, implementation of link fault signaling as described in 46.3.4 is optional."
