Annex 120G EH/VEC Values

Matt Brown, Huawei, 802.3ck Editor-in-Chief

Introduction

- In Draft 1.4 the measurement method for EH and VEC was modified such that the specified values of EH and VEC need to be revisited.
- This slide package summarizes the values for EH and VEC as proposed by the following comments:
 - 5, 40, 61, 72, 75, 76, 77, 78, 80, 81, 88, 145
- These comments cover all four test points:
 - TP1a (host output), 120G.3.1, Table 120G-1
 - TP1 (module input), 120G.3.4, Table 120G-10
 - TP4 (module output), 120G.3.2, Table 120G-3
 - TP4a (host input), 120G.3.3, Table 120G-7

EH and VEC need be to computed for the histogram window.

SuggestedRemedy

Change Eye height, differential (min) to 10 mV
Change Vertical eye closure (max) to 13 dB

The editor's note indicates that the specified values for EH/VEC value may need to be updated due to measurement method being updated in D1.4.

SuggestedRemedy

Provide updated values for host output, module output, host input, and module input if necessary and remove editor's note.

Due to we adopted the new EH & VEC test methods in D1p4, the specifications of EH & VEC for "Table 120G-1 - Host output characteristics at TP1a" and "Table 120G-10 - Module stressed input parameters" shall be updated to reflect the impact by new method.

SuggestedRemedy

Propose to change EH from 15 mV to 8 mV in Table 120G-1 & 120G-10.
Propose to change VEC from 9.0 dB to 12.0 dB in Table 120G-1.
Propose to change VEC (max) from 9.5 dB to 12.5 dB in Table 120G-10.
Propose to change VEC (min) from 9.0 dB to 12.0 dB in Table 120G-10.
Detailed analysis is included in wu_3ck_01_0121.pdf

The eye height and vertical eye closure limits were based on (simulated) measurements of a vertical slice of the eye at the nominal sampling time. The measurement method for eye height and vertical eye closure in 120G.5.2 has been modified to use a vertical slice of the eye spanning -50 to +50 mUI around the nominal sampling time. Comparison of measurement results implies that the change in the measurement method results in up to a 3 dB increase in vertical eye closure and a similar decrease in eye height.

SuggestedRemedy

In Table 120G-1, change "Eye height, differential (min)" to 10 mV and "Vertical eye closure (max)" to 12 dB.
In Table 120G-3, change "Near-end eye height, differential (min)" and "Far-end eye height, differential (min)" to 17 mV and "Near-end vertical eye closure (max)" and "Far-end vertical eye closure (max)" to 10.5 dB.
In Table 120G-7, change "Near-end eye height" and "Far-end eye height" to 17 mV and "Near-end vertical eye closure" and "Far-end vertical eye closure" to 10.5 dB.
In Table 120G-10, change "Eye height" to 10 mV, "VEC (max)" to 12.5 dB, and "VEC (min)" to 12 dB.

For a reasonably clean module (or test equipment in a host stressed eye test), the driver swing has to be aggressively reduced to deliver only 24 mV at near end, short setting. 120E has 70 mV.

SuggestedRemedy

Eye height limits should be set sensibly for short and long modes, near and far - not all the same.

Change the NEEH from 24 mV to 40 mV.

VEC NE/FE @ TP4a	7.5/7.5	same as TP4	?

Summary

- There is no clear consensus on any of the values, however the proposed values are similar to each other for each parameter.
- We need to agree upon a new value for each of the parameters.
