#### Rolfe, Benjamin

#### Comment Type **TR** Comment Status A

"However, an implementation shall ensure that all possible frame alignment positions are evaluated." is an incorrect use of "shall". This is not stating a verifiable requirement: the "all possible" is an unbounded (infinite) set. There would need to be (likely is) a finite set of frame alignment positions that should be evaluated. To be a valid requirement, you would need to change "possible" to "defined" and then provide a reference to where the defined set of frame alignment positions is enumerated and defined. Then at least you have a valid statement of a requirement. Tho the prior sentence suggests such specification is out of scope of this standard (kind of what "not specified" means). Also, does the SLIP function evaluate every defined position every time, or as suggested by the first sentence, only the next one in the (undefined) list of valid positions? I can see why y'all decided to leave this "implementation dependent" :-).

#### SuggestedRemedy

Delete "However, an implementation shall ensure that all possible frame alignment positions are evaluated."

Response

### Response Status C

ACCEPT IN PRINCIPLE.

While significant freedom is allowed regarding how an implementation finds the FAS pattern, and there is no expectation that an implementation test additional positions after the FAS pattern has been located, there is a requirement that an implementation can find FAS pattern in any possible position.

#### Change:

"However, an implementation shall ensure that all possible frame alignment positions are evaluated."

To.

"An implementation shall ensure that the FAS pattern can be detected in any possible position."

Rolle, benjamin		Dinu Creek Associates
Comment Type	TR	Comment Status A
"The synchro	nization	state diagram determines" really isn't correct The diagra

ram specifies something, it can illustrate something, it can even indicate something, but it can not determine anything. A diagram an specify how the synchronization process determines something, which is what I suspect you mean.

#### SuggestedRemedy

change to: The synchronization process determines when the SC-FEC has detected the location of the frame alignment sequence in the received bit stream for a given lane of the PMA service interface.

Response Response Status C

ACCEPT IN PRINCIPLE.

Numerous other clauses use similar wording, so in principle, it could be left as is without any risk to implementations.

#### However, it is more accurate to Change:

"The synchronization state diagram determines when the SC-FEC has detected the location of the frame alignment sequence in the received bit stream for a given lane of the PMA service interface."

#### To:

"The SC-FEC sublaver uses this process to detect the location of the frame alignment sequence in the received bit stream on each lane of the PMA service interface."

The description of the sources from which the SC FEC receives information (PCS, Inverse RS-FEC, or PMA) and the destinations to which it sends information (PCS or PMA) are not consistent.

#### SuggestedRemedy

Revise the last sentence of the paragraph to include the Inverse RS-FEC as a potential destination: The FEC:IS\_UNITDATA\_i primitives are defined for i = 0 to 19. The PCS, Inverse RS-FEC, or PMA continuously sends 20 parallel bit streams to the SC-FEC sublayer, each at a nominal signaling rate of 5.15625 GBd. The SC-FEC, or PMA, one per lane, each at a nominal signaling rate of 5.15625 GBd.

In the description of when the SIGNAL\_OK is set to FAIL, the sentence should begin with "The" rather than "That" for consistency.

#### SuggestedRemedy

Revise the 3rd sentence, replacing 'That' with 'The': The SIGNAL\_OK parameter of the FEC:IS\_SIGNAL.indication primitive can take one of two values: OK or FAIL. The value is set to OK when the FEC receive function has identified codeword boundaries as indicated by fec\_align\_status equal to TRUE. The value is set to FAIL when the FEC receive function is unable to reliably establish codeword boundaries as indicated by fec\_align\_status equal to FALSE.

Response

ACCEPT.

Figure 153-5 does not clearly indicate the flow into the 'XOR' functions at the top of the figure. There should be arrowheads on the tops of the vertical lines (as figure 11-3 of ITU-T G.709, on which this figure is based, includes).

#### SuggestedRemedy

Add arrowheads pointing into the three XOR functions on the vertical lines

Response Response Status C

ACCEPT IN PRINCIPLE.

See suggested remedy to accepted comment I-35.

Response to comment I-35 was:

Add right facing arrows before the squiggles on the two bottom lines. Add upward arrows to the three vertical lines to the XOR (circled plus) at the top

C/ 153	SC ·	153.2.3.2.7	P88	L <b>40</b>	# 1-22
Huber, Thor	nas		Nokia		
Comment Ty	ype	Е	Comment Status A		bucket

It would be better to write the sentence below figure 153-6 in the passive voice (the FEC frame doesn't do the distribution; its contents are distributed).

#### SuggestedRemedy

Replace: The entire FEC frame consisting of 4080 × 4 octets distributes 51 groups of 16 octets to each of the 20 FEC lanes. With: 51 groups of 16 octets are distributed from the FEC frame (consisting of 4080 x 4 octets) to each of the 20 FEC lanes.

Response Response Status C

ACCEPT.

The black link characteristics in Table 154-10 are specifically to satisfy the project objective of 80 km over a DWDM link. This can only be done on by defining a black link "appropriate for the inclusion of one or more optical amplifiers" (thus without actually requiring it). Then	The inclusion of note "b" in table 154-9 might be interpreted to imply that we're either defining two PHYs or that both data points are not mandatory, which was not the intent. It's also not necessary to convey the requirements accurately, and therefore could be removed.
fiber loss is not specified. The specification methodology is based upon that principle. Because of the intent to serve unamplified applications it would be useful to add one or	SuggestedRemedy

What the Clause 153 SC-FEC sublayer does is much the same as what the Clause 50         WAN Interface Sublayer does: it takes a 64B/66B encoded stream and puts it in a telecoms style wrapper. The SC-FEC is quite different to the "KR4" or "KP4" FEC. Also, this PHY uses a telecoms style clock domain on the line. It doesn't work by "using 100GBASE-R encoding". While it may carry a 64B/66B stream, what it actually uses is SC-FEC framing, and is significantly different to all in-force BASE-R (or BASE-P) PHYs.         uggestedRemedy         Change "using 100GBASE-R encoding, DP-DQPSK modulation" to "using 100GBASE-R encoding, GMP mapping, SC-FEC framing, and DP-DQPSK modulation". (If the group is ashamed of using all those things, it could change how the PHY works, but that would be more disruptive.)         esponse       Response Status       U         REJECT.       The commentor has not demonstrated how changing it would improve the quality of the draft. The same comment was submitted as technical, not required in D2.0, comment 139 (see https://www.ieee802.org/3/ct/comments/D2P0/8023ct_D2p0_comments_final_by_clause.pd f, page 5) and the working group modified the wording to the current definition.	that is data-rate Clause 49.) 1.4.31 100GBA encoding and a (See IEEE Std 1.4.32 100GBA encoding and a 802.3, Clause 8 1.4.33 100GBA 82 for 100 Gb/s DQPSK has a s sublayer does is takes a 64B/66I quite different to domain. #### Comment Type TR Comment Status A

802.3 writes interoperability specifications. The definitions of transmitter, receiver and channel must each be independently complete enough so that any compliant transmitter, receiver and channel will interoperate. The transmitter and receiver have specified power ranges; the channel must have specifications that control the loss or gain for compliant transmitted signals so that the power window at TP3 is met. In G.698.2, 7.4.1 Maximum and minimum mean input power:

"This parameter (together with the maximum and minimum mean channel output power) also places a requirement on the maximum and minimum channel insertion loss (or gain) of the black link.

The requirement is that while the mean channel output power at point SS is within the specified limits, the channel insertion loss (or gain) of the black link for that channel must be such that the power level at point RS is within the maximum and minimum mean input power limits."

So in G.698.2, there is a channel insertion loss (or gain) requirement. Here, with the three pieces specified separately, the channel insertion loss (or gain) spec has got lost in translation, and a channel can be compliant with any amount of loss, even when obviously unusable.

#### SuggestedRemedy

Add black link specifications in 154.7.3, preferably in Table 154-10, so that a black link will deliver the right power at TP3, giving effect to what G.698.2 says, "while the mean channel output power at point SS [TP2] is within the specified limits, the channel insertion loss (or gain) of the black link for that channel must be such that the power level at point RS [TP3] is within the maximum and minimum mean input power limits". Different for amplified and non-amplified cases. Add associated PICS.

#### Comment Type TR Comment Status A

Inadequately defined term. This says "OSNR and OSNR(193.6) are defined in Recommendation ITU-T G.698.2, G.698.2, 7.4.2, says "optical signal-to-noise ratio (OSNR) is the ... value of the ratio of the signal power in the wanted channel to the ... noise power density (referred to 0.1 nm) ..." Not "...to the noise power in 0.1 nm". So it's power / power density. The units then would be dB/nm maybe? But they aren't. And, what does G.698.2 mean by "signal power"? Is it the average power, the OMA, or something else? I see that 7.2.12, Maximum error vector magnitude, has a "signal power" derived after some mathematical manipulation from a measurement, but I believe that OSNR existed before EVM, so that's probably a different thing.

#### SugaestedRemedv

Provide an unambiguous definition of OSNR

Response Response Status C

ACCEPT IN PRINCIPLE

In this context signal power means average signal power.

See resolution to comment # i-82.

The resolution to comment I-82 was:

The current definition for OSNR and OSNR(193.6) is currently in 154.8.11 Transmitter inband OSNR(193.6). Make it more generic to apply to other OSNR relevant definitions, with editorial license.

See also resolution to comment #i-42 and I-53 which adds OSNR to 1.5 and spells out abbreviation in its first use in the body in the body of the document in 154.8.11.

The resolution to comment I-42 was:

The resolution to comment I-53 was:

Add "OSNR - optical signal-to-noise ratio" after MFAS in sublcause 1.5 and in 154.8.11 modify heading to read "Transmitter in-band optical signal-to-noise ratio (OSNR)" with editoral license.

### Comment Type TR Comment Status R

This draft lacks a sensitivity or stressed sensitivity spec, but has a spec for receiver OSNR tolerance(193.6), defined in 154.8.16 by reference to G.698.2, where 7.4.3 defines it as at: worst EVM RMS, IQ offset, optical return loss at point SS, receiver connector degradations and measurement tolerances, but excluding chromatic dispersion, non-linear effects, reflections from the optical path. PMD. PDL and optical crosstalk. This would need a great deal of interpretation to turn into an actual measurement, with too much opportunity for alternative choices and disagreement. 802.3 doesn't put measurement tolerances in parameter values like that, they are the measurer's problem not the standard's. Not specifying the receiver for tolerance to chromatic dispersion is contrary to all 802.3 SMF specs since 2002. Not having a specific stressed sensitivity spec is contrary to all 802.3 SMF specs since 1998. It is not clear that receiver OSNR tolerance(193.6) enforces the right receiver sensitivity for the unamplified link.

#### SuggestedRemedy

Add clear, specific receiver sensitivity criteria, addressing signal strength, sinusoidal jitter. EVM RMS, IQ offset, chromatic dispersion, and for the amplified case, OSNR. Make the unamplified case a "major option" if it's more onerous than the amplified case. If it makes sense to specify tolerance to OSNR and some other things in one specifem. and chromatic dispersion and some others in another spec item, as G.698.2 does, do so. Because this PMD has its own clock domain, the sinusoidal iitter won't be the usual amount. Add associated PICS.

Response Status U Response

REJECT.

The comment does not provide a specific proposal or provide evidence that the suggested change will improve the guality of the draft.

Furthermore it is very similar to previously submitted comments #15 to D2.1

(https://www.ieee802.org/3/ct/comments/D2P1/8023ct D2p1 comments final by ID.pdf, page 4) and #140 to D2.0

(https://www.ieee802.org/3/ct/comments/D2P0/8023ct D2p0 comments final by ID.pdf, page 28) which were both rejected.

Straw poll: I support not making any changes to the draft based on this comment.
