 Comment Type **ER** Comment Status **A**
 "black link" refers to a method of link specification, not the link itself.
SuggestedRemedy
 Remove the definition for "black link". In its place, insert "black link methodology - the specification of the input, output, and transfer characteristics of the uni-directional transmission path between TP2 to TP3 for a given DWDM channel, without specifying how the transmission path is implemented. (See, for example, IEEE Std 802.3, Clause 154, Figure 154-3)".
 Replace all instances of "black link" used as a noun with "DWDM channel" throughout the draft.
 Ensure that all instances of "black link" as an adjective use the consistent wording "black link methodology" (rather than "black link approach") throughout the draft.
Response Response Status **C**
 ACCEPT IN PRINCIPLE.

CI 1 SC 1.4.160a P26 L14 # R1-50
 D'Ambrosia, John Futurewei Technologies, U.S. Subsidiary of Huawei
 Comment Type TR Comment Status A
 The term Black Link is used to represent the aggregate of DWDM Channels, as well as the methodology to describe the input, output, and transfer characteristics of the uni-directional transmission path between TP2 to TP3 for a given DWDM channel are specified, without specifying how the transmission path is implemented.
 It is felt that this will cause future readers confusion.
 SuggestedRemedy
 Modify term Black Link to Black Link Methodology to focus on the specification methodology, and change definition to - the specification of the input, output, and transfer characteristics of the uni-directional transmission path between TP2 to TP3 for a given DWDM channel within a DWDM Link, without specifying how the transmission path is implemented. (See, for example, IEEE Std 802.3, Clause 154, Figure 154-3)
 Response Response Status C
 ACCEPT IN PRINCIPLE.

D'Ambrosia, John Futurewei Technologies, U.S. Subsidiary of Huawei

Comment Type GR Comment Status D

This is a pile-on to comment I-3
 Commenter agrees with CRG that comment I-3 should be rejected, but does not fully agree with the provided reasoning for rejecting the comment as being too limited.
 I-3 commenter argues that the term "channel spacing" is adequate for use in this standard, and redefining the term to be WDM specific is a bad idea. Commenter also points at the IEE-SA Standards Definition.

The current and only definition of "channel spacing" provided in the IEEE Standards Dictionary Online is - "The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter." It is clear that the current definition is not applicable, as it is specific to a radio transmitter.

As noted in A.2 Item C of the 2020 IEEE SA Standards Style Manual - New definitions that serve to add a new definition to an existing term(s) of the same name should be different enough from the other term(s) so as to justify the addition. Having more than two or three acceptable definitions for any term is discouraged.

Therefore, as noted, in the comment, this definition is an industry accepted term and the definition is referenced back to ITU-T G.694.1

SuggestedRemedy

Make no change to document.

D'Ambrosia, John

Futurewei Technologies, U.S. Subsidiary of Huawei

Comment Type TR Comment Status A

The definition of DWDM Link should not include the DWDM PHYs to align with ITU-T use of the term DWDM Link.

SuggestedRemedy

Change definition of DWDM Link to DWDM Link – an aggregate of DWDM channels over either a single optical fiber or a single optical fiber per direction

This effectively changes the naming of the "gray box" , ie everything between TP2 and TP3 for all channels, from Black link to DWDM link - therefore all instances of the term Black link used to describe everything between TP2 and TP3 (and not the Black Link methodology) should be replaced with term DWDM link.

Response Response Status C

IEEE P802.3ct D3.1 100 Gb/s over DWDM systems 1st Sponsor recirculation ballot comments

CI 1 SC 1.4.237c P22 L37 # R1-8

Trowbridge, Stephen Nokia

Comment Type ER Comment Status A

DWDM PHY is an unnecessary and misleading definition. The reference points adjacent to the PHY (TP2 and TP3) are single-channel reference points with no DWDM present. The fact that the transmission paths (DWDM channels) used by multiple PHYs may be combined using DWDM in the middle of the link doesn't need to be reflected in how the PHY is named.

SuggestedRemedy

Remove the definition DWDM PHY. Replace "DWDM PHY" with "100GBASE-ZR PHY" throughout the draft.

Comment Type T Comment Status A

"Fixing the value of SIGNAL_DETECT from the PMD sublayer at OK allows the upper layers to determine whether a valid signal is being received, e.g., according to the ability to acquire frame alignment."

This sentence does not make sense. The upper layers can "determine whether a valid signal is being received" regardless of the value of SIGNAL_DETECT; this is not the reason that SIGNAL_DETECT is fixed to OK. In fact, in this PHY the SC-FEC (a specific upper layer) is required to make this determination, as specified in 153.2.1 - so "ability to acquire frame alignment" is not a mere example.

The change of this subclause from the previous draft requires a clear statement that the signal detect functionality is the responsibility of the SC-FEC sublayer.

SuggestedRemedy

Change the quoted sentence to

"The presence of a valid signal is determined only by the SC-FEC sublayer (see 153.2.1)".

Third and fourth paragraphs would read better if they were combined and reorganized.

SuggestedRemedy

Replace the paragraphs with this text: Figure 154-3 shows a generic example of a DWDM channel specified using the black link methodology and identifies the location of the single channel interfaces at TP2 and TP3. The DWDM channel includes wavelength division multiplexing and demultiplexing supporting simultaneous transport of a maximum of n DWDM channels on a single fiber, and may also include optical amplification. The grey-shaded box in Figure 154-3 is used to indicate that the implementation details of the DWDM channel are outside the scope of this clause. The arrangement of (DWDM) elements within the figure is not intended to place constraints on the construction of the link.

CI 154 SC 154.6 P111 L27 # R1-37

Maki, Jeffery Juniper Networks, Inc.
 Comment Type TR Comment Status A

The project objectives include, "Provide a physical layer specification supporting 100 Gb/s operation on a single wavelength capable of at least 80 km over a DWDM system." The draft defines DWDM system. See "Clause 1.4.237d DWDM system: An aggregate of DWDM links optically multiplexed and demultiplexed onto and off either a single optical fiber or a single optical fiber per direction." The text on line 27 of page 111 says, "Figure 154-3 shows a generic example of a black link." However, upon inspection, the example is not generic with respect to the definition of DWDM system. It depicts only one of the two cases. It depicts the case of "single optical fiber per direction." The case of "single optical fiber," which would correspond to bi-direction propagation over a single fiber, is not depicted. Accommodation is made in the draft for the Tx and Rx wavelengths of the PMD to be different to support bi-directional propagation with distinct wavelengths.

SuggestedRemedy

Expand Figure 154-3 to include the case of a DWDM system using a "single optical fiber" for both directions in addition to the single optical fiber per direction that is already depicted. Expand test describing Fig. 154-3 to cover the addition.

Ran, Adeo Intel Corporation

Comment Type T Comment Status A

(Subclause number is from the clean document - it appears as 154.7 in the diff document)

"The 100GBASE-ZR PMD specification covers a maximum of 48 channels over a DWDM system, supporting between 1 and 48 channels, with a channel spacing of at least 100 GHz."

This sentence reads as if a 100GBASE-ZR link can span multiple channels in a DWDM system. I assume this is not the intent.

"In a working DWDM link, the combination of a 100GBASE-ZR Tx, the associated DWDM channel, and a 100GBASE-ZR Rx are configured to support the same channel center frequency."

This should probably read 100GBASE-ZR link, and the same center frequency should be used, not just supported.

SuggestedRemedy

Change the quoted sentences to

"The 100GBASE-ZR PMD can use one of 48 channels (specified by center frequency) over a DWDM system, where the channel spacing is at least 100 GHz. In a working 100GBASE-ZR link, the 100GBASE-ZR Tx, the associated DWDM channel, and the 100GBASE-ZR Rx are all configured to have the same channel center frequency."

Comment Type TR Comment Status A

Updated text for this subclause has essentially modified the definition / name of the medium for the PHY, which disagrees with the definition 1.4.237a DWDM channel.

Text in 154.7 reads - The medium associated with the 100GBASE-ZR PMD is also referred to as a DWDM channel which is defined as the transmission path on a single wavelength/frequency (referred to either by channel index number or channel center frequency) on a defined frequency grid between a DWDM PHY transmitting to another DWDM PHY over a black link."

Furthermore, the heading of the subclause has now been modified and indicates the new medium to be The DWDM Channel over a black link. The medium is the DWDM channel. There was no agreement to change the definition.

SuggestedRemedy

1. In Figure 154-1, modify "ZR = PMD FOR DWDM CHANNEL OVER A BLACK LINK" to "ZR = PMD FOR DWDM CHANNEL"
2. Change heading of 154.7 back to "The DWDM channel"
3. Modify noted sentence in comment to "The medium associated with the 100GBASE-ZR PMD is also referred to as a DWDM channel which is defined as the transmission path on a single wavelength/frequency (referred to either by channel index number or channel center frequency) on a defined frequency grid between a DWDM PHY transmitting to another DWDM PHY."

Comment Type **ER** Comment Status **A**

Sentence states
 "The 100GBASE-ZR PMD is specified on the assumption that it is part of a DWDM system where on the multichannel part inside the black link multiple DWDM optical signals are present, each sourced by a separate 100GBASE-ZR transmitter."
 Three issues
 1. Replace DWDM system with DWDM link
 2. Appropriate operation of 100GBASE-ZR could be a single channel, and does not have to support multiple DWDM channels
 3. Clarity of sentence could be improved

SuggestedRemedy

Reword paragraph
 Each DWDM channel in a DWDM link supports unidirectional transmission between a pair of 100GBASE-ZR PMDs. Full duplex operation between a pair of 100GBASE-ZR PMDs will require two DWDM channels. Each DWDM channel operates on a DWDM frequency grid, defined by Table 154-6, which shows the mapping of the 100GBASE-ZR channel index numbers to the optical channel center frequencies. This grid corresponds to the DWDM frequency grid defined by Recommendation ITU-T G.694.1. The channel center frequency of the 100GBASE-ZR PMD transmitting and 100GBASE-ZR PMD receiving should be selected to support the same channel center frequency as the DWDM channel to which the two 100GBASE-ZR PMDs are connected.

Response Response Status **C**

ACCEPT IN PRINCIPLE.

CI 154 SC 154.7 P122 L37 # R1-52

D'Ambrosia, John Futurewei Technologies, U.S. Subsidiary of Huawei

Comment Type TR Comment Status A

The following sentence has several problems

1. A 100GBASE-ZR PHY is required to support 1 to 48 channels, so therefore, a valid implementation could support only a single wavelength. Therefore, the use of the word "configured" is problematic for these types of PHY devices. In this instance the user would need to select the PHY that supports the wavelength that matches the desired DWDM channel.

2. A user might interpret the 100GBASE-ZR Rx to be in the same PHY device as the 100GBASE-ZR Tx.

SuggestedRemedy

Suggested rewording - The channel center frequency of the 100GBASE-ZR transmitting and 100GBASE-ZR receiving should be selected to support the same channel center frequency as the DWDM channel to which the two 100GBASE-ZR PHYs are connected.

Dawe, Piers J G NVIDIA

Comment Type TR Comment Status R

With regard to D3.0 comment 58, tolerance to chromatic dispersion was not enforced: optical clauses usually have something like TDP or TDECQ involving a measurement of the transmitted after chromatic dispersion to enforce good transmitter behaviour. I believe EVMrms does not do this, so is there a gap that needs to be filled? Does the maximum spectral excursion provide the necessary protection?

SuggestedRemedy

Ensure that the combination of transmitter and max / min dispersion will deliver a usable signal.

Response Response Status U

REJECT.

The commenter has not provided any evidence that the specification is allowing devices passing the requirements while not operating not satisfactorily in the field for the range of DWDM black links specified.

The technology generally used for DP-DQPSK modulated devices inherently have an extremely high tolerance to chromatic dispersion by design, not requiring the addition of specific parameters. The dispersion limits specified in Table 154-9 for the DWDM black link are a sufficient condition in combination with the optical path penalties specified.

Ran, Adeo Intel Corporation

Comment Type T Comment Status R
(Subclause number is from the clean document - it appears as 154.8.1 in the diff document)

The transmit characteristics in Table 154-7 include "Average channel output power", shouldn't it be the transmitter power (at TP2)? The term "channel output" intuitively reads as the output of the DWDM channel (to which the transmitter is not responsible).

Note that 154.9.3 "Average channel output power" refers to "the test setup in Figure 53-6", which is in 53.9.2 "Optical power measurements", and 53.9 states that "All optical measurements shall be made through a short patch cable, between 2 m and 5 m in length." (as does 154.5.1) - so this measurement is at TP2. But it is not clear from the table or the text in this amendment.

SuggestedRemedy

Change "channel output power" to "output power", both in Table 154-7 and in 154.9.3.

If there is a good reason to keep the word "channel", state explicitly in the table "at TP2".

Response Response Status C

REJECT.

This comment does not apply to the substantive changes between IEEE P802.3ct/D3.1 and IEEE P802.3ct/D3.0 or the unsatisfied negative comments from the previous ballots. Hence it is not within the scope of the recirculation ballot.

The parameter name "channel output power" is consistent with accepted industry terminology, such as in-force Recommendation ITU-T G.698.2 and there is no technical need to make a change. The reference to "channel" in "channel output power" is relevant because of the inherent connection to DWDM channels. Furthermore all transmitter parameters are specified at TP2 by default.

CI 154 SC 154.7.1 P124 L42 # R1-63

Ran, Adeo Intel Corporation

Comment Type T Comment Status D Bucket
(Subclause number is from the clean document - it appears as 154.8.1 in the diff document)

Error vector magnitude (max) can be interpreted as a peak value. But EVM is defined in G.698.2 as an RMS value.

The definition in 154.8.1 does not include RMS either. However, 154.9.14 and 154.9.16 mention EVM_RMS (which is what should be used everywhere).

SuggestedRemedy

Change "Error vector magnitude" to "Error vector magnitude (RMS)" and EVM to EVM_RMS (subscript) everywhere.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

This comment does not apply to the substantive changes between IEEE P802.3ct/D3.1 and IEEE P802.3ct/D3.0 or the unsatisfied negative comments from the previous ballots. Hence it is not within the scope of the recirculation ballot. However, the changes suggested are an improvement to the draft that would otherwise need to be made in Maintenance.

In 154.9.14 and 154.9.16 change "EVMrms" to "EVM", which is completely consistent with parameter naming in Recommendation ITU-T G.698.2.

New proposed response after posting:

Dawe, Piers J G NVIDIA

Comment Type T Comment Status A

In Table 154-8, 100GBASE-ZR receive characteristics, there are entries for: Receiver sensitivity (max) (informative), Receiver OSNR (min), and Receiver OSNR tolerance (not max or min).
 154.9.13, Average receive power, says:
 The average receive power shall be within the limits given in Table 154-8. These limits define the range of average receiver input power over which the BER requirement must be met at the values of minimum OSNR defined in Table 154-8.
 154.9.15, Receiver OSNR, says:
 The Receiver OSNR shall be within the limits given in Table 154-8 over the average receive power range specified in Table 154-8. OSNR is defined in 154.9.11.
 154.9.16, Receiver OSNR tolerance, says:
 Receiver OSNR tolerance shall be within the limit given in Table 154-8 and is defined in Recommendation ITU-T G.698.2...

As the receiver can't choose the OSNR it receives, it seems the entries for "Receiver OSNR (min)" are not specifications for the receiver to meet, as the PICS puts it, but that they are conditions for average receive power (or average receive power are conditions for receiver OSNR), similar to the conditions of a stressed receiver sensitivity test or a receiver interference tolerance test for other PMDs. The "shall" in 154.9.15 is unworkable as the text stands, unlike the "shalls" in 154.7.1 and 154.8 for Transmitter in-band OSNR (min) and OSNR at TP3 (min).

SuggestedRemedy

Combine 154.9.13 and 154.9.15 and make the terminology consistent, e.g.:
 In Table 154-8, change "Receiver OSNR (min)" to "Minimum OSNR at TP3". In 154.9.13, change "minimum OSNR" to "minimum OSNR at TP3", and add "OSNR is defined in 154.9.11.". Delete 154.9.15.
 Table 154-8 could be clarified, e.g. with a footnote linking average receive power and receiver OSNR, or by putting these rows next to each other.

Response Response Status C

ACCEPT IN PRINCIPLE.

See response to comment R1-73.

The response to comment R1-73 was:

REJECT.

The receiver OSNR (min) is an essential performance parameter for the receiver to meet, specified at its input TP3.
 This requirement is not only a requirement for the output at TP3 of the DWDM black link. Removing it from the list of receiver parameters will not improve the quality of the draft.

Straw poll was taken:

I support the proposed response (R1-73):

Yes: 11

No: 3

There was no consensus to make a change.

See response to comment R1-99.

Zhang, Bo Inphi Corporation

Comment Type T Comment Status R

Receiver OSNR (min) specs (35dB and 19.5dB) are redundant information as already specified in table 154-9. For example, 35dB min OSNR for average receive power < -16dBm is already specified in line#45 in table 154-9, and 19.5dB min OSNR for power >-16dBm is already specified in line #47-48 in the same table on page 115.
 Furthermore, these specs are really link requirements and the naming should be indicating 'link-delivered OSNR' instead of 'Receiver OSNR'

SuggestedRemedy

Recommend completely remove 'Receiver OSNR (min)' line specs in table 154-8

Response Response Status C

REJECT.

The receiver OSNR (min) is an essential performance parameter for the receiver to meet, specified at its input TP3.
 This requirement is not only a requirement for the output at TP3 of the DWDM black link. Removing it from the list of receiver parameters will not improve the quality of the draft.

Comment Type T Comment Status D

(Subclause number is from the clean document - it appears as 154.8.2 in the diff document)

Table 154-10 has "Receiver OSNR (min)" and the associated definition in 154.9.15 has a "shall" so it seems that the receiver is required to something. But is OSNR (not OSNR tolerance) a characteristic of the receiver? from the definition of OSNR in 154.9.11 it seems out of the receiver's control.

G.698.2 only defines OSNR tolerance (in 7.4.3). Is anything required from the receiver other than OSNR tolerance?

SuggestedRemedy

Clarify the requirements in 154.9.15, or remove Receiver OSNR (min) from the table and delete 154.9.15.

Given that both "Optical path OSNR penalty (max), for OSNR at TP3 < 35 dB (12.5 GHz)" and "Optical path penalty (max), for OSNR at TP3 >= 35dB (12.5 GHz)" have the same value -- in other words the, the OSNR penalty is the same regardless of the OSNR level -- it seems like these two parameters could be consolidated together into a single parameter and table entry.

SuggestedRemedy

Modify "Optical path OSNR penalty (max), for OSNR at TP3 < 35 dB (12.5 GHz)" to be "Optical path OSNR penalty (max)", and delete the table entry for "Optical path penalty (max), for OSNR at TP3 >= 35dB (12.5 GHz)".

Response Response Status C

REJECT.

Response to comment R1-71 changed "optical path penalty" to "optical path power penalty"

There is a fundamental difference between "Optical path penalty" (now "optical path power penalty") which is an optical power penalty, in contrast to "Optical path OSNR penalty", which is an OSNR penalty due to the optical path.

CI 154 SC 154.8 P115 L51 # R1-71

Zhang, Bo Inphi Corporation

Comment Type T Comment Status A Bucket

optical path penalty is a newly defined parameter in the black link table and could be confused with the optical path OSNR penalty for ASE limited link. This new parameter as the way it is defined could be viewed as a superset of optical path OSNR penalty. Also, the 3dB value lacks some data support, and could require more discussion to converge.

SuggestedRemedy

Recommend change the naming of 'optical path penalty' to 'optical path power penalty' or 'optical path receive sensitivity penalty' to be more specific.

Response Response Status C

ACCEPT IN PRINCIPLE.

Change "optical path penalty" to "optical path power penalty"

IEEE P802.3ct D3.1 100 Gb/s over DWDM systems 1st Sponsor recirculation ballot comments

CI 154 SC 154.9.16 P119 L22 # R1-79

Dawe, Piers J G NVIDIA

Comment Type TR Comment Status D

With respect to D3.0 comment 85 about jitter bandwidth: there is a jitter bandwidth implied in the EVMrms definition, although it is done in a way that is very specific to a real-time scope, unlike other 802.3 optical clauses. "worst-case values of EVMrms" could mean worst distortion/noise but little jitter or worst jitter but little distortion/noise. Different receivers will react differently to these alternatives.

SuggestedRemedy

Clarify the signal jitter in the definition of receiver OSNR tolerance. It may be that two conditions will be needed, analogous to the stressed sensitivity/RITT and jitter tolerance requirements in other clauses.

Proposed Response Response Status W

PROPOSED REJECT

Reference is made to comment 85 IEEE P802.3ct/D3.0, which is about the number of samples N in EVM testing and not about jitter bandwidth.

Therefore this comment does not apply to the substantive changes between IEEE P802.3ct/D3.0 and IEEE P802.3ct/D3.1 or the unsatisfied negative comments from the previous ballot.

Hence it is not within the scope of the recirculation ballot.

The proposed remedy would imply that the receiver performance would be specified for various different cases of worst case EVM and thus for all kinds of different impairments. This would imply that various transmitter impairments, for instance IQ offset, IQ skew, jitter would need to be specified separately for impact on the receiver performance, which is something the Task Force has not agreed to do for the specification of OSNR tolerance, because it would be virtually impossible to specify the worst case condition.

Related comment I-55 to D3.0 to add clear, specific receiver sensitivity criteria, addressing signal strength, sinusoidal jitter, EVM_RMS, IQ offset, chromatic dispersion, and for the amplified case, OSNR, was rejected by the Task Force after a straw poll was taken: "I support not making any changes to the draft based on this comment."

Y - 19

N - 5

A - 3

As a result it was concluded that there was no consensus to make a change to the document on comment I-55.

Because OSNR tolerance is a parameter similar to receiver sensitivity, except that it applies to low OSNR conditions (lower than 35 dB) in contrast to receiver sensitivity applying to high OSNR conditions (equal to or larger than 35 dB).

Comment Type TR Comment Status A

This statement is problematic - Because in this application DWDM technology is used to transport multiple DWDM channels over a single fiber.....

While it is true that multiple DWDM channels may happen over a single fiber - 100 Gb/s Ethernet is full duplex - so a 100GBASE-ZR PHY will utilize two DWDM channels, and these two channels may exist on either one fiber or two fibers.

SuggestedRemedy

Proposed revision- DWDM technology allows the transport of multiple DWDM channels over a single fiber. For communication between two 100GBASE-ZR PHYs two channels will be required - one channel in each direction of transmission. These two channels may reside on a single optical fiber or a single fiber per direction. A black link methodology is used to allow specificaiton.....

Add two figures showing single direction or bidirection support as noted in next comment

Change Y axis naming to "OSNR at TP3 dB (12.5 GHz)"

CI 154A SC 154A.2 P132 L33 # R1-89

Dawe, Piers J G NVIDIA

Comment Type T Comment Status D

For a total black link passive loss of 34 dB, Tx -8 to 0 dBm, Rx -16 to 0 dBm, the net gain must be between -8 to 0 dBm so the amplification must be between 34-8 = 26 and 34-0 = 34 dB unless the link knows or reacts appropriately to the input power, channel by channel -- not 18 to 42 dB.

SuggestedRemedy

Provide more explanation as to how this is to work, or change to the simple conservative example

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Modify the relevant sentence to:

"This suggests an amplification between 18 dB per channel (for maximum difference between black link input and output power of 16 dB) and 42 dB per channel (for a maximum difference between black link input and output power of -8 dB)."

Exactly how optical amplifiers react to varying operating conditions (power, number of channels, etcetera) is the responsibility of the black link designer and not within the scope of Clause 154.

 It may be worth noting that these examples are all assuming worst case impairments: the receiver sensitivity without impairments is 30 dBm, but in the presence of the worst case optical impairments that the system is required to tolerate there is a maximum 3dB optical path penalty, resulting in the quoted "Average Receive Power" of 27 dB. That is probably the correct figure to use in the calculations, but there could be value in making it clear to the reader -- since it is an example -- that this is a worst case scenario, so to speak.
 SuggestedRemedy
 Modify the following sentences:

"The achievable distances across the multi-channel fiber between the optical multiplexer and demultiplexer will be determined by the total loss from TP2 to TP3, less the total loss of optical multiplexer and demultiplexer, and the loss of potentially present patch panel connectors. The maximum allowable loss over the black link can be calculated from the difference between the minimum average receive power (at TP3) and the minimum transmitter average channel output power (at TP2), which is 19 dB."

To read as follows:

"The achievable distances across the multi-channel fiber between the optical multiplexer and demultiplexer will be determined by the total loss from TP2 to TP3, less the total loss of optical multiplexer and demultiplexer, the loss of potentially present patch panel connectors, and the optical path penalty due to impairments. The maximum allowable loss over the black link can therefore be calculated from the difference between the minimum average receive power (at TP3) and the minimum transmitter average channel output power (at TP2), which is 19 dB."

The use of the term "4:1 optical multiplexer" in Tables 154A-2, 154A-3, 154A-4, and 154A-5 implies that each table/calculation is using the exact same optical multiplexer; whereas the key difference between each table is the use of a different optical multiplexer.

I would suggest modifying those entries to match what is actually being used in that specific table.

SuggestedRemedy

In Table 154A-2, change "Allocation for loss of 4:1 optical multiplexer" to read "Allocation for loss of 40 channel optical multiplexer".

In Table 154A-2, change "Allocation for loss of 4:1 optical demultiplexer" to read "Allocation for loss of 40 channel optical demultiplexer".

In Table 154A-3, change "Allocation for loss of 4:1 optical multiplexer" to read "Allocation for loss of 16 channel optical multiplexer".

In Table 154A-3, change "Allocation for loss of 4:1 optical demultiplexer" to read "Allocation for loss of 16 channel optical demultiplexer".

In Table 154A-4, change "Allocation for loss of 4:1 optical multiplexer" to read "Allocation for loss of 4 channel optical multiplexer".

In Table 154A-4, change "Allocation for loss of 4:1 optical demultiplexer" to read "Allocation for loss of 4 channel optical demultiplexer".

In Table 154A-5, remove the entries for "Allocation for loss of 4:1 optical multiplexer" and "Allocation for loss of 4:1 optical demultiplexer" to reflect the fact that neither is present in the example.

Comment Type T Comment Status D

The values chosen for the optical multiplexer, optical demultiplexer, and patch panel in Table 154A-2 all seem excessive. In an activity at CableLabs involving representatives from a variety of manufacturers from this product space, for example it was agreed that a loss of 5 dB for a 40 channel mux or demux was a safe value to use, and was probably excessive compared to modern equipment. Similarly, a value of 1 dB for an optical distribution frame (patch panel) was more than sufficient. As a result, while admittedly an example with suitable disclaimers, the resulting example distance reach significantly underestimates what is most likely commonly possible.

The same patch panel values are also used in Tables 154A-3, 154A-4, and 154A-5 and should be updated to remain consistent, while the mux/demux loss figures should be re-evaluated as well (as they may also be high).

I can bring a contribution to address this point in the future.

SuggestedRemedy

Modify the multiplexer and demultiplexer allocation loss figures in Table 154A-2 from 6 dB to 5 dB, and modify the patch panel loss from 2 dB to 1 dB and update the resulting calculations as appropriate.

Also modify the patch panel loss figure from 2 dB to 1 dB for each of Tables 154A-3, 154A-4, and 154A-5.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Add a note to the section that the example values shown are conservative and that other values lead to other potential distances. With editorial license.

Schmitt, Matthew Cable Television Laboratories Inc. (CableLabs)

Comment Type E Comment Status D

In Tables 154A-2, 154A-3, 154A-4, and 154A-5, there are two sets of calculations: one for a fiber attenuation figure of 0.275 dB/km, and one for a fiber attenuation figure of 0.21 dB/km. However, in subclause 154A.2, the text makes reference to using a figure of 0.25 dB/km.

While this isn't technically wrong per se -- since they are all called out -- this creates an apparent disconnect or lack of consistency in the text. It may be desirable to keep these sections more aligned.

SuggestedRemedy

Several options are possible, including (but not limited to):

1. Modifying the text in 154A.2 to refer to the same range of values as used in the tables in 154A.3;
2. Modifying the 0.275 dB/km value to 0.25 dB/km in the 4 tables in 154.3, so that at least one of the values being used aligns with the text in 154A.2; or
3. Modifying the tables in 154A.3 to all use a single value of 0.25 dB/km.

Proposed Response Response Status W

Comment Type T Comment Status D

Regarding table 154A-2, 154A-3, 154A-4, while one can appreciate the change of the table title from 40 channels, down to 16 channels and then 4 channels, the line items 'allocation for loss of 4:1 optical multiplexer/demultiplexer' remain the same in description yet the values are reduced from 6, to 4 and then 2dB, which does not make sense for a 4 channel multiplexers.

SuggestedRemedy

Recommend modify the description name 'allocation for loss of 4:1 optical multiplexer/demultiplexer', and adjust their values accordingly to make practical sense (for example, a 50/50 coupler would incur 3.x dB loss).
