C/ 140 SC 140.6.1

| C/ 140 | SC 140.6.1 | P 41 | L 37 | # 24 |
|-------------|--------------|------------------|-------------|---------|
| Dudek, Mike | e | Marvell | | |
| Comment Ty | /pe T | Comment Status D | | interop |

There is a problem with the signal detect for 100GBASE-FR1. The threshold in 140.5.4 refers to the minimum received power in Table 140-7 which is -6.9dBM, however there is a note that it is informative. The -6.9dBm is calculated as the max channel loss (4dB) below the minimum transmitter average power in table 14-6 (or -2.9dBm) but that number is informative and at infinite extinction ratio the average power would be -3.2dBm, resulting in a minimum average input power of -7.2dBm. (Note the problem is even worse in 100GBASE-DR but fixing that would be out of scope.)

SuggestedRemedy

Make the Average launch power (min) for 100GBASE-FR1 to be normative. (note this is needed to ensure inter-operability on the signal detect with 100GBASE-DR, otherwise the Average Receiver power (min) could have been adjusted instead.

Proposed Response Response Status W

PROPOSED REJECT.

Average launch power (min) is informative for all PAM4 optical PMDs in 802.3.

Subclause 140.10a (Requirements for interoperation between 100GBASE-DR, 100GBASE-FR1 and 100GBASE-LR1) is also informative and was added to provide guidance to end users on how to interconnect the different PMD types. It should not be the primary reason for changing PMD optical specifications, e.g. changing average launch power (min) from informative to normative.

Update (5/26):

PROPOSED ACCEPT IN PRINCIPAL

Implement the following changes througout the draft.

In Table 140-6: Change the Average launch power (min) for 100GBASE-FR1 from -2.9dBm to -3.2dbm

In Table 140-7: Change the Average receive power (min) for 100GBASE-FR1 from -6.9dBm to -7.2dBm

In Section 140.10a.1:

Change:

"The 100GBASE-FR1 and 100GBASE-DR PMDs can interoperate with each other provided that the fiber optic cabling (channel) characteristics for 100GBASE-DR (see 140.10 and Table 140–12) are met"

to:

"The 100GBASE-FR1 and 100GBASE-DR PMDs can interoperate with each other provided

TYPE: TR/technical required ER/editorial required GR/general required T/technical E/editorial G/general COMMENT STATUS: D/dispatched A/accepted R/rejected RESPONSE STATUS: O/open W/written C/closed U/unsatisfied Z/withdrawn SORT ORDER: Clause, Subclause, page, line

that the fiber optic cabling (channel) characteristics for 100GBASE-DR (see 140.10 and Table 140–12) are met and the 100GBASE-FR1 transmitter average power is greater than or equal to the value for average launch power (min) for 100GBASE-DR in Table 140-6."

| C/ 140 SC | C 140.6.1 | P 41 | L37 | # 22 |
|--------------|-----------|------------------|-----|---------|
| Dudek, Mike | | Marvell | | |
| Comment Type | т | Comment Status D | | interop |

To improve inter-operability between 100GBASE-LR1 and 100GBASE-DR the average launch power min for LR1 needs to be increased a little and needs to be made normative. With the existing OMA numbers and not knowing what the loss of a 100GBASE-DR channel is it is possible to use an attenuator on the output of the 100GBASE-LR1 transmitter with an attenuation between 0.8dB and 1.1dB except that with the 1.1dB attenuator and a max loss 100GBASE-DR channel the 100GBASE-DR receiver signal detect might not detect the input. It is very convenient to use a single value attenuator with using to know the loss of the channel and this allows the use of a 0.95dB attenuator with +/-0.15dB tolerance.

SuggestedRemedy

Increase the average launch power (min) for 100GBASE-LR1 from -2dBm to -1.8dBm. Change note" a" to say "For 100GBASE-LR1 to ensure inter-operability with 100GBASE-FR1 and 100GBASE-DR the average launch power min is normative, for 100GBASE-FR1 and 100BASE-DR the average launch power min is informative."

Proposed Response Response Status W

PROPOSED REJECT.

Subclause 140.10a (Requirements for interoperation between 100GBASE-DR, 100GBASE-FR1 and 100GBASE-LR1) is informative and was added to provide guidance to end users on how to interconnect the different PMD types. It should not be the primary reason for changing PMD optical specifications.

The commenter has not provided data on the impact of the proposed change on the 100GBASE-LR1 transmitter.

Update 5/26:

PROPOSED ACCEPT IN PRINCIPAL

In Table 140-15: Change the Max Loss for the direction "100GBASE-LR1 transmitter to 100GBASE-DR receiver" from 4.1dB to 3.9dB.

spell out how to do that (because it depends too much on the details of how a particular scope works).

Specify the "hit ratio" for the measurement. This should be better than 5e-5 but not so demanding that an over/under-shoot measurement would take longer than a TDECQ measurement (even though the calculation afterwards is trivial in comparison). Adjust the spec limit if these changes give different measured numbers. Make similar changes in Clause 151.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

The word "if" is used in all other PMD clauses. The reason for using "if" is to emphasize that none of these parameters are required to be measured, but if they are then the correct test pattern and method is to be used.

"Equalizer turned off" is not defined.

SuggestedRemedy

add to the end of the sentence "i.e. with the tap 2 coefficient set to 1 and all other tap coefficents set to zero". Also to the end of line 49. As an alternative this definition of "equalizer turned off" could be added to section 151.8.5.4 and these two sentences could be changed to ".... using the TDECQ reference receiver with the equalizer turned off (see 151.8.5)."

Response

ACCEPT IN PRINCIPLE.

Change the sentence in 151.8.9:

from:

"Transmitter over/under-shoot is measured using the TDECQ reference receiver (see 151.8.5) with the equalizer turned off."

Response Status C

to.

"Transmitter over/under-shoot is measured using the TDECQ reference receiver (see 151.8.5) with the equalizer turned off, i.e. with one of the tap coefficients set to 1 and all other tap coefficients set to 0."

The test definition in 151.8.9 needs to be updated to provide correct values when using the compliance SSPRQ pattern.

The current overshoot (OS) and undershoot (US) limits were determined experimentally by Rodes and Bhatt. OS/US measurements were made on a large set of transmitters. The transmitters were then each placed in a system to correlate transmitter performance to system level results including error floors and overload conditions. OS/US limits of 22% were set based on what levels of transmitter performance resulted in unacceptable system level performance. The OS/US values were based on a measurement using a square wave, while the system results used SSPRQ. The OS/US compliance pattern is SSPRQ. as the square wave yields optimistic OS/US values compared to the SSPRQ. To reconcile the differences between test patterns, the transmitters from the original experiment set were retested using the SSPRQ pattern. The OS/US test method was also modified using a hit ratio method, where a small percentage of samples are allowed to exist above the OS or below the US limit. This has the added benefit of providing consistent results independent of the waveform sample population. Rather than change the current spec limit of 22%, the hit ratio method is adapted to yield equivalent system level differentiation at the same 22% limit. That is. OS/US values observed using SSPRQ and hit ratio vield the same OS/US values as the square wave method used in the original results. Correlation with system level performance is maintained. By experimentation, the hit ratio that achieves this correlation was determined to be 1e-2.

SuggestedRemedy

Change line 33:

Pmax: is based on a 1e-2 hit ratio, where Pmax is the smallest power level that results in the number of samples above that level not exceeding the product of hit ratio and total number of observed samples, with all samples acquired in a single unit interval eye diagram

Change line 35

Pmin: is based on a 1e-2 hit ratio, where Pmin is the largest power level that results in the number of samples below that level not exceeding the product of hit ratio and total number of observed samples, with all samples acquired in a single unit interval eye diagram

Response

Response Status C

ACCEPT
