Grow, Robert RMG Consulting / KDPOF

Comment Type **E** *Comment Status* **A** *…r P802.3 comment resolution*

The sort order in data rate introduction clauses like this are incosistent when listing the PHY Types at a given data rate or ordering sublayers in various delay constraint tables. Comments have been entered on P802.3/D3.0 about this, and we need to remain aware if there are any changes to establish a more global sort order for such tables. This could affect our changes to Clauses 44, 105, 125, and 131.

SuggestedRemedy

Monitor P802.3/D3.0 comment resolutions and update as required.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
The editor will track P802.3/D3.0 comment resolution and then change base text.

Hayashi, Takehiro HAT Lab.

Comment Type **E** *Comment Status* **R** *EZ*

"change" occurs in plus and minus directions.

SuggestedRemedy

Use "increment"

Response *Response Status* **C**

REJECT.
The TXO_MSGT is a single bit that effectively changes with each new transmitted message. TXO_MSGT is a single bit sequence number. Because some conventions will prevent incrementing beyond the maximum value of a field, the term "change" is used. With a one bit value, change and complement would have he same effect and direction of change is not relevant.

SuggestedRemedy

"type"

Response *Response Status* **C**

ACCEPT.

Cl **166** *SC* **166.1.4** *P* **64** *L* **38** # 54

Pérez - Aranda, Rubén KDPOF

Comment Type **T** *Comment Status* **A** *symetric BASE-AU PHY type*

"and the same BASE-AU Type in TX and RX" is not clear in the meaning. On top of that, it is clear that TX and RX of link partners have to implement the same BASE-AU PHY type, e.g. 25GBASE-AU, because in other case they cannot communicate. However, the specification of clause 166 is compatible with having different BASE-AU type from local TX and local RX of a PHY, e.g. it is possible to establish a bidirectional link where a fiber direction operates at 2.5Gb/s and other fiber direction operates at 50 Gb/s, provided that link segment is compatible with both in terms of attenuation, bandwidth, etc.Disclaimer: the commenter only pursues consistency through spec, but not necessarily indicates preference on asymmetric rates, out of the scope.

SuggestedRemedy

Replace paragraph of lines 37 and 38 with: "This clause specifies the operation between link partners implementing the same BASE-AU PHY type and rate in both link partners for each of the fibers used for unidirectional transmission." Replace line 40 with: "A BASE-AU PHY TX shall be composed by PCS, PMA and PMD sublayers specified for the same data rate. A BASE-AU PHY RX shall be composed by PCS, PMA and PMD sublayers specified for the same data rate." Add corresponding PICS item.

Response *Response Status* **C**

Pérez - Aranda, Rubén KDPOF

Comment Type **T** *Comment Status* **A** *symetric BASE-AU PHY type*

Figure 166-2 is not 100% accurate. PMA should be split into PMA RX and PMA TX in order to be 100% consistent with specification. PMA TX and PMA RX may operate at different rate, being compatible with the specification in C/ 166. The figure should not reflect a different vision of the spec.Disclaimer: the commenter only pursues consistency through spec, but not necessarily indicates preference on asymmetric rates, out of the scope.

SuggestedRemedy

Replace PMA box with two boxes: PMA TX and PMA RX, in the left and right sides of the topology.

Response *Response Status* **C**

ACCEPT.

Cl **166** *SC* **166.2.6.1.2** *P* **83** *L* **83** # 112

Pérez - Aranda, Rubén KDPOF

Comment Type **T** *Comment Status* **A** *PCS transmit state machine*

T_BLOCK_TYPE will classify /LI/ as error (E), so LPI mode will not be entered even for a PHY supporting LPI. Asymmetries between XGMII/25GMII and 50GMII (i.e. LI).As it is specified in 166.4, the The BASE-U PCS transmit function in LPI operation mode shall monitor codified 65-bit blocks to detect the condition to resume to normal operation mode.In general, the TX state diagram, as it is specified, has the problem of preventing the LPI operation mode in the PHY, because LPI is not encoded in the generated 65-bit blocks. 64B/65B transmit state diagram has to be transparent encoding /LI/ (fast wake LPI principle).

SuggestedRemedy

Use Clause 49 as reference to revise PCS 64B/65B transmit state functions and state diagram encoding XGMII and 25GMII, so that LPI is encoded in a transparent way. PCS 64B/65B TX state diagram has to be identical to C/49, with the difference of generating 65-bit blocks instead of 66-bit-blocks. Use Clause 82 as reference to revise PCS 64B/65B transmit state functions and state diagram encoding 50GMII, so that LPI is encoded in a transparent way. PCS 64B/65B TX state diagram has to be identical to C/82, with the difference of generating 65-bit blocks instead of 66-bit-blocks. Pay attention that state diagrams of Figures 49-16 an 82-16 are identical. Only state functions have differences due to the differences between XGMII/25GMII and 50GMII.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE. Use IEEE 802.3/D2.2 Figure 49-16 or Figure 82-16 as base for modification.

REJECT. This draft follows "https://mentor.ieee.org/myproject/Public/mytools/draft/styleman.pdf". In page 33 can be read "Figures should be organized to fit on a single page with the term, “Figure” and the figure number, followed by an em dash and the figure title, centered below the figure, as follows: “Figure 1—Title”.".
The FrameMaker V5.0 template automatically arranges the figures and tables in the document layout. The editor of a draft places an anchor for the figure or table at first reference in text. As content is added or deleted in future drafts, where FrameMaker positions tables and figures will change. This will continue up through publication preparation after approval of a draft standard. Publication editors examine if figures or tables have floated too far from where they are referenced at that time and will adjust as they deem appropriate.

“When the xMII and PMA sublayer data rates are not synchronized, the receive process inserts idles, deletes 5 idles, or deletes sequence ordered sets to adapt between rates.”This is confuse. PMA recovers data and clock, which are provided to PCS. The xMII is source synchronous, so the clock is defined by the PCS. If different clock domains are used for each sublayer is a matter of implementation, nothing to do with interoperability.Rate matching is performed in the PCS transmit function. See 166.2.5.

Comment Type **T** *Comment Status* **A** *LPI*

Shall statement is not correct. According to 78.1.3.3.1, Fast wake refers to the mode for which the transmitter continues to transmit signals during Low Power Idle so that the receiver can resume operation with a shorter wake time (as shown in Figure 78–4). For transmit, other than the PCS encoding LPI, there is no difference between fast wake and normal operation. This s partially true for the LPI operation defined for BASE-AU PHYs. It is true that transmitter continues to transmit signals during Low Power Idle. However, it is not true that for transmit, other than the PCS encoding LPI, there is no difference between fast wake and normal operation, e.g. RS-FEC CW are replaced.

SuggestedRemedy

Replace paragraph as (introductory w/o shall statements): A BASE-AU PHY that implements the optional EEE capability follows fast wake mode of LPI operation as specified in 78.1.3.3.1 in the sense the PHY transmitter remains transmitting signals during LPI (same symbol rate and modulation of normal mode). However, the data generated by the PCS sublayer is modified with respect to transparent LPI encoding of normal operation in order to allow power saving, robust OAM side communication channel and robust wake signal detection in the receiver.

In automotive applications, PMD signal detect function is used for implementation of wake-up / sleep functionality. For example, in ECUs integrating 1000BASE-RHC ports, reception of optical power over a threshold is used to wake up a full ECU from deep-sleep state where only few tens of micro-amperes are consumed from the battery.

SuggestedRemedy

Add at the end of line 4: "PMD_RXDETECT.indication(OK) may be used to wake up from deep sleep in a system that includes a BASE-AU PHY." Add at the end of line 7: "PMD_RXDETECT.indication(FAIL) may be used to transition a system that includes a BASE-AU PHY into deep sleep."
