Stassar, Peter	Huawei			-	de Koos, A	Indras	Microchip Tec

#### Comment Type TR Comment Status X

The text in the last bullet under 124.8.5 "The 400GBASE-DR4-2 or 800GBASE-DR8-2 transmitter is tested using an optical channel with dispersion and insertion loss as specified for 100GBASE-FR1 in 140.7.5.2, and optical return loss at the maximum for optical return loss tolerance specified in Table124–6." was agreed as a resolution to comment #130 to D1.0. The embedded compliance channel requirements are somewhat indirect and it would be much clearer if a special section be created with details and especially a Table with channel requirements, following the style of 151.8.5.1, especially because there is no precedence for channel requirements for DR type PMDs over 2 km.

#### SuggestedRemedy

Create a new subclause 124.8.5.1 with channel requirements for 400GBASE-DR4, 400GBASE-DR4-2, 800GBASE-DR8, and 800GBASE-DR8-2, following the specific proposal in a presentation

#### Comment Type T Comment Status X

From 802.3cx (D3.3) Clause 90.7.2, an MII extender device should avoid insertion/deletion of alignment markers and idles. But as described in Clause 171, there is no provision to do this in the 800GXS Sublayer.

#### I can make a presentation to explain this further, if needed.

"NOTE 5—When TX\_NUM\_BIT\_CHANGE and RX\_NUM\_BIT\_CHANGE are not available (e.g., over physical interfaces such as instantiated xMII or AUI), it is recommended to avoid insertion and removal of Idles, alignment markers, and codeword markers in the sublayers below the xMII/AUI, when possible, to reduce timestamping accuracy impairments (see Annex 90A)."

#### SuggestedRemedy

There should be a provision that an MII Extender device (PHY 800GXS + standard 800G PHY) can optionally avoid any modification to the MII stream, and any modification of the position of alignment markers or codeword markers with respect to the MII, between the input and output.

 Comment Status X

As explained in 802.3cx (D3.3) Clause 90.7.3, transmitter skew can be problematic for timestamping. This should be flagged when discussing the skew limits for SP1, SP2, SP3.

"Lane skew is possible on a transmitter with multiple PCS and PMA/PMD lanes when these lanes have different static latencies such that their alignment markers appear staggered as they depart the device at the MDI output. Since transmit skew in series with medium skew is not strictly additive, transmit skew can contribute to time synchronization error by obscuring the actual latency of the medium. Transmit skew is expected to be minimized, ideally to zero, representing an ideal case for the accuracy of a TimeSync Client."

#### SuggestedRemedy

After Table 169-5, add a note that for 800GEGb/s devices that implement timestamping, transmitter skew (skew points SP1, SP2 and SP3) should be minimized, ideally to zero. Can point to Clause 90.7.3.

Comment Type T Comment Status X

Support of FEC degrade in the 800GMII extender sublayers requires that the 800GXS uses monitor states in the PCS below, but the base standard (Clause 117, 118, and 119) do not define a signal across the 800GBASE-R PCS and DTE 800GXS service interfaces (800GMII). Instead Clause 118 makes reference to status bits in the PCS (Clause) 119. Keeping with common conventions, signals across the PCS service interface should be defined to convey the degrade state and the signal referenced in each sublayer.

#### SuggestedRemedy

Update 800GMII to include FEC degrade signaling across the 800GMII. Update the 800GBASE-R PCS to include the generation of the FEC degrade signal. Update the PHY 800GXS to use the new FEC degrade signal rather than the status bit(s) in the PCS. A presentation will be provided.

Comment Type TR Comment Status X

The skew constraints for 800 Gb/s in ns are the same as those for earlier generations, as early as 40 Gb/s, Table 80-8.

The size of PCS buffers required for deskewing grows linearly with the data rate; the size is quite large even at 400G, and would be doubled at 800G, due to the doubling of the number of PCS lanes. The current skew limit of 160 ns at the PCS receive requires about 150 kilobits per port just for deskewing. This affects both latency and power consumption across the industry.

The original skew limits were probably exaggerated even for 40G, and there is no need to carry them on for new technologies and new PCS designs. The numbers we set in 802.3df will also affect hosts and modules (with XS) in 802.3dj, so are worth considering carefully now.

The numbers below are in "UI" of a PCS lane equal to 37.64706, although most skews are created on physical interfaces where the real UI is 18.82 ps.

- Limit of Skew generated at SP1 is currently 770 "UI", it can safely be reduced to 256 "UI" (512 UI of a PMD, or 8 clock cycles in a typical SerDes).

- Limit of Skew generated at SP2 is currently 1142 "UI", allowing additional skew of ~350 "UI" by the PMA in the module; this can safely be reduced to 128 "UI" (4 clock cycles of a typical SerDes; 384 "UI" including the reduced SP1)

- Limit of Skew generated at SP3 is currently 1434 UI, allowing additional skew of ~290 "UI" by the PMD; this can safely be reduced to 128 "UI" (4 clock cycles of a typical SerDes; 512 "UI" including the reduced SP2)

- Limit of Skew generated at SP4 is currently 3559 UI, allowing additional skew of 2125 "UI" (80 ns, ~16 m of fiber) by the media; this can safely be reduced to ~4 m of fiber or 512 "UI" (1024 "UI" including the reduced SP3)

- Limit of Skew generated at SP5 is currently 3852 UI, allowing additional skew of ~300 "UI" by the PMD; this can safely be reduced to 128 "UI" (4 clock cycles of a typical SerDes; 1152 "UI" including the reduced SP4)

- Limit of Skew generated at SP6 is currently 4250 UI, allowing additional skew of ~400 "UI" by the PMA; this can safely be reduced to 128 "UI" (4 clock cycles of a typical SerDes; 1280 "UI" including the reduced SP5)

- Limit of Skew generated at the PCS receive is currently 4781 UI, allowing additional skew of ~530 "UI" by the PMA collocated with the PCS; this can safely be reduced to 128 "UI" (4 clock cycles of a typical SerDes; 1408 "UI" including the reduced SP6)

The result could be a reduction of the allowed skew by 70%, which allows a significant saving in PCS buffer size.

The suggested remedy lists skew as an exact number of "UI" and an approximate number in ns (unlike the current table). It can also be the other way around.

#### SuggestedRemedy

Change the skew table to Skew point | max skew ns (approx.) | max skew UI

SP1 | 6.8 | 256 SP2 | 10.2 | 384 SP3 | 13.6 | 512 SP4 | 27.2 | 1024 SP5 | 30.6 | 1152 SP6 | 34 | 1280

PCS input | 37.4 | 1408

Change skew limits in the PCS, PMA, and PMD clauses accordingly.

Proposed Response Response Status **O** 

C/ 169	SC 169.5	P169	L38	# 16
Ran, Adee	9	Cisco		
Comment	Type T	Comment Status X		

Skew variation is dominated by SP4 minus SP3 - the media contribution - which is currently 3.4-0.6=2.8 ns, corresponding to more than 0.5 m of fiber.

It seems unlikely that fibers dynamically "shrink" or "expand" (effectively) that much.

It is suggested to reduce this contribution by a factor of 4, to 0.7 ns (about 14 cm of fiber). This will affect the maximum skew variation at points below SP4 too.

#### SuggestedRemedy

Change the values in the SP4 row and below: SP4 | 1.3 | 69 SP5 | 1.5 | 80 SP6 | 1.7 | N/A At PCS receive | 1.9 | N/A

Change skew variation limits in the PCS, PMA, and PMD clauses accordingly.

Ran, Adee		Cisco			

Comment Type TR Comment Status X

The FEC degrade functionality in clause 119 is not useful, especially at 100 Gb/s per lane signaling. It is now common knowledge that correlated errors (which can occur due to DFEs and other reasons) can cause FEC failure even when the average SER is "good", so the average SER that this feature measures is not enough to predict when errors are going to occur.

We now have a better way to predict FEC performance through the codeword bin counters, which can be accessed through management; the FEC degrade "feature" should not be carried over to 800G Ethernet.

#### SuggestedRemedy

Delete 169.6 and 171.5, and edit other places where FEC degrade is mentioned in this draft to remove this feature.

Replace all references to the FEC degrade in clause 119 with text stating that FEC degrade is not defined for the 800GBASE-R PCS and XS.

Table 172–1 has "reset" as the first column, but reset is not defined in clause 172.

Similarly, LBLOCK\_T, EBLOCK\_T, T\_TYPE and the block types C, T, S, D, ENCODE, and tx\_raw are not defined anywhere in this draft.

#### SuggestedRemedy

Add text pointing to the definitions of LBLOCK\_T and EBLOCK\_T in 119.2.6.2.1, reset and tx\_raw in 119.2.6.2.2, and T\_TYPE and ENCODE in 119.2.6.2.3.

Proposed Response Response Status **O** 

C/ 172	SC 172.2.4.1.1	P198	L <b>40</b>	# 20
Ran, Ade	e	Cisco		
-				

Comment Type TR Comment Status X

Table 172-1 column "T\_TYPE (tx\_raw\_i-1)" has cells with the strings "C + T" and "S + D". These seem to be based on the state diagram convention that "+" is a logical-OR, but this is not a state diagram, and the letters are not conditions, so it isn't very clear. Using "or" would be preferable (as in the similar Table 172–4).

In addition, for each of these two strings there are two rows with two values in "T\_TYPE (tx\_raw\_i)" column; these can be merged with the word "or" as well.

#### SuggestedRemedy

Merge rows 2 and 5 to a single row with columns: "0 | C or T | C or S | ENCODE (tx\_raw\_i)". Merge rows 3 and 4 to a single row with columns: "0 | S or D | D or T | ENCODE (tx\_raw\_i)".

The FLR value that results from 2.4E-4 BER is referred to in two places, in lines 7 and 10:	Comment Type TR Comment Status X
	Same as previous comment, except the value is already updated to 1.7E-12 in part that instructs to "Insert a new third paragraph in 167.1.1"
This BER allocation enables a frame loss ratio lower tha 9.2 x 10 <sup>-13</sup> after processing by he PCS".	
	SuggestedRemedy
And on line #10. " to maintain a frame loss ratio lower than 9.2 x 10^-13."	Change 1.7E-12 to 3.4E-12 in two places
This FLR value, 9.2E-13, corresponds to a "non-interleaved" RS(544,514) FEC as used in he 50G & 100G PCS. The value should be changed to 1.7E-12 for 200G and 400G PCS which have 2-way interleaved FEC, and should be changed to 3.4E-12 for 800G PCS with I-way interleave FEC.	Proposed Response Response Status O
This same issue was addressed in comment #62 of 802.3bs D1.3: https://www.ieee802.org/3/bs/comments/P802d3bs_D1p3_comments_final_ID.pdf#page=13	
The FLR scaling factor of (1 +MFC)/MFC should be modified to be (1 + 2*MFC)/MFC for he 2-way interleave PCS and to (1 + 4*MFC)/MFC for the 4-way interleaved PCS.	
restedRemedy	
Remove 800G from this paragraph. Keep origin paragraph referring to 200G/400G, but shange the FLR value to 1.7E-12.	
Add a similar pargraph after this one with references changed from 200G/400G to 800G and FLR value to 3.4E-12.
