# CA Minimum Loss

Comment 303

# CA Minimum Loss

## Comment #303

CI 179 SC 179.11.2 P441 L39 # 303

Kocsis, Sam Amphenol

Comment Type T Comment Status D Minimum loss (E)

The minimum cable assembly insertion loss of 16dB, may exclude working cables from compliance.

SuggestedRemedy

Adjust the minimum cable assembly insertion loss to a value aligned with working cables as demonstrated in contribution. Contribution to follow at the November plenary.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Pending referenced presentation and CRG discussion.

REJECT.

Reducing the minimum loss has the implication of requiring receiver testing with a lower loss cable. This requires such cables to be generally available for testing purposes, and possibly increases the burden on receivers (shorter is not necessarily easier). There is no indication that such cables are available, nor data to check the feasibility of reference receivers working with such cables.

There are several comments suggesting that available MCBs have lower IL than the reference by about 1 dB, and proposing reduction of the reference. This may be related to the perceived lower IL of cable assemblies (by about 2 dB). However, these comments were not accepted.

There was not consensus to make the suggested change.

Table 179–16—Cable assembly characteristics summary

Description	Reference	Value	Unit
Insertion loss at 53.125 GHz, <i>ILdd</i> (max)	179.11.2		
CA-A		19	dB
CA-B		24	dB
CA-C		29	dB
CA-D		34	dB
Insertion loss at 53.125 GHz, <i>ILdd</i> (min)	179.11.2	16	dB
Minimum cable assembly FRI <sup>a</sup>	179.11.3	8.25	dB
Differential-mode to common-mode return loss, <i>RLcd</i>	179.11.4	Equation (179–20)	dB
Common-mode to common-mode return loss, <i>RLcc</i>	179.11.5	Equation (179–12)	dB
Minimum COM	179.11.6	3	dB
Channel signal to common-mode ratio, <i>SCMR<sub>CH</sub></i> (min)	179.11.7	20	dB
NOTE—The expected cable assembly reach is 0.5 m for CA-A, 1 m for CA-B, 1.5 m for CA-C, and 2 m for CA-D. Compliant cable assemblies may be longer. The length of a cable assembly does not imply compliance to specifications.			

<sup>a</sup> Cable assemblies with a COM greater than 4 dB are not required to meet minimum ERL.

The comment is similar to Comment #360 against D2P1.

Comment #232 revisits MCB allocation in D2P2.

Table 179A-3—Minimum Insertion loss budget values at 53.125 GHz

Link Configuration	$ILdd_{CA,min}$ (dB)	$ILdd_{TP0d-TP2,min}$ (dB)	$ILdd_{TP3-TP5d,min}$ (dB)	$ILdd_{MTFref}$ (dB)	$ILdd_{Ch,min}$ (dB)
Host-Min to Host-Min	16	8.25	8.25	9.75	13

## CA Minimum Loss Comment #303

In D2P2, we do not have any tests for  $ILdd_{Ch,min}$ . In past projects, the minimum Host has been defined as the MCB, but that is not the case with 3dj.

The resolution for Comment #232 would changed the host channel allocation from 4.45 dB to 3.45 dB.

It is suggested to keep that value as 4.45 dB and instead make  $ILdd_{CA,min}$  14dB, as shown on the right.

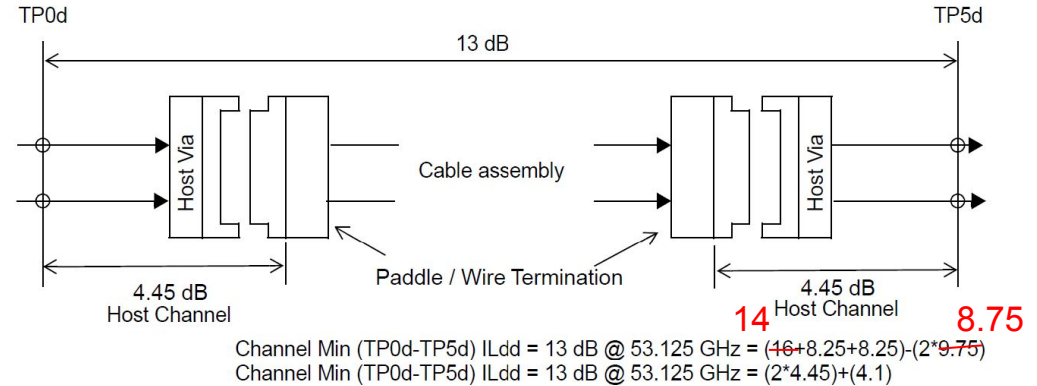

Figure 179A-3— Channel Min (TP0d-TP5d) at 53.125 GHz

Editor's recommendation: AIP (since no new data is presented) ;  
Change  $ILdd_{CA,min}$  to 14dB, and change appropriate values in 179, and 179A.  
Implement with editorial license

## CA Minimum Loss Comment #303

There are some ripple effects to this change, related to receiver tolerance testing.

The current tests in Table 179-14 do not really test HL, HN, and HH, but rather CA-B, CA-C, and CA-D.

The details of refining Table 179-14 are beyond the scope of the comment, and changes would be deferred to a future draft.

Table 179–14—Interference tolerance test parameters

Parameter	Test L (low loss)		Test H (high loss)		Units
	Min	Max	Min	Max	
Test pattern	PRBS31Q				
Test channel insertion loss at 53.125 GHz <sup>a</sup>					
Host class HL	15.5	16.5	36.5	37.5	dB
Host class HN	15.5	16.5	31.5	32.5	dB
Host class HH	15.5	16.5	26.5	27.5	dB
Cable assembly insertion loss at 53.125 GHz					
Host class HL	15.5	16.5	33.5	34.5	dB
Host class HN	15.5	16.5	28.5	29.5	dB
Host class HH	15.5	16.5	23.5	24.5	dB
COM <sup>b</sup>	3		3		dB

<sup>a</sup> Insertion loss between the two test references (see Figure 110–3b).

<sup>b</sup> COM is calculated as defined in 179.9.5.3.3. Meeting the test requirements with a lower value of COM demonstrates margin to the specification but is not required for compliance.

# Test fixtures

Comment 141

# Text fixtures

## Comment #141

CI 179B SC 179B.2.1 P904 L40 # 141

Healey, Adam

Broadcom, Inc.

Comment Type T Comment Status D test fixtures (E)

For the TP2/TP3 test fixture, the reference point is defined to be the "center of the edge connector pad". In 179B.3.1, it is stated that the reference point for the cable assembly test fixture is the "mating point of the MDI connector". There is a note in 179B.4.2 that states the reference insertion loss for the mated test fixture is the sum of the reference insertion losses for the TP2/TP3 test fixture and cable assembly test fixture. This suggests that the "center of the edge connector pad" and the "center of the edge connector pad" are the same reference point. If this is the case, then the same name/description should be used in both instances.

### Suggested Remedy

Call the reference point either "center of the edge connector pad" or "mating point of the MDI connector" consistently in both 179B.2.1 and 179B.3.1. Consider adding a note to Figure 179A-1 to describe the this reference point since the illustrations do not clearly show it.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

The commenter points out a nomenclature conflict that must be remedied. The use of "mating point of the MDI connector" is most appropriate to apply to both instances. For completeness, the editorial team will prepare a detailed proposed response for the CRG to review.

# Text fixtures

## Comment #141

### 179B.2.1

The TP2 or TP3 test fixture reference insertion loss is defined as the insertion loss between the reference plane of the coaxial connector and the **center of the edge connector pad**. The reference insertion loss is defined by Equation (179B-1) and illustrated by Figure 179B-1. The effects of differences between the insertion loss of an actual test fixture and the reference insertion loss are to be accounted for in the measurements.

### 179B.3.1

The cable assembly test fixture reference insertion loss is defined as the insertion loss between the reference plane of the coaxial connector and the **mating point of the MDI connector**. The reference insertion loss is defined by Equation (179B-2) and illustrated by Figure 179B-1. The effects of differences between the insertion loss of an actual test fixture and the reference insertion loss are to be accounted for in the measurements.

Editor's recommendation:

Change the highlighted text in 179B.2.1 (TP2 or TP3 test fixture) to “mating point of the MDI connector”.

# Text fixtures

## Comment #407, #408

CI 179B SC 179B.1 P904 L13 # 407

Swenson, Norman

Nokia, Point2

Comment Type E Comment Status D (B1) (E)

This is the normative clause that defines the TP2 or TP3 test fixtures. The test fixtures assume an MDI connector, a PCB board, and a coaxial connector enabling connection to test equipment, but that is not stated anywhere.

### SuggestedRemedy

Replace the first paragraph of 179B.1 with the following:

"Transmitter and receiver measurements at TP2 or TP3 for the 200GBASE-CR1, 400GBASE-CR2, 800GBASE-CR4, and 1.6TBASE-CR8 hosts (see Annex 179D) and at TP1a or TP4a (see Figure 176D-4) for the 200GAUI-1, 400GAUI-2, 800GAUI-4, and 1.6TAUI-8 C2M hosts (see Annex 176D), are made utilizing test fixtures. Each such test fixture has an edge connector plug that is compatible with the MDI receptacle on the host board, a coaxial connector for each lane suitable for connection to test equipment, and a PCB connecting the lanes from the edge connector plug to the coaxial connectors. The test fixture reference insertion loss is specified in 179B.2."

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

The commenter points out that the draft never explicitly defines the structures in an HCB test fixture. The proposed additional text may be better suited as an addition to 179B.2, as follows:

"The TP2 or TP3 test fixture (also known as Host Compliance Board) is required for measuring the transmitter and receiver specifications at TP2 and TP3. The test fixture has an edge connector interface that is compatible with the appropriate MDI connector on the Host board, and provides a high-speed electrical path between the MDI connector and the coaxial connector that defines the TP2 or TP3 test point. The TP2 and TP3 test points are illustrated in Figure 179A-1."

CI 179B SC 179B.1 P904 L13 # 408

Swenson, Norman

Nokia, Point2

Comment Type E Comment Status D (B1) (E)

This is the normative clause that defines the Cable test fixtures. The test fixtures assume an MDI connector, a PCB board, and a coaxial connector enabling connection to test equipment, but that is not stated anywhere.

### SuggestedRemedy

Replace the second paragraph of 179B.1 with the following:

"Cable assembly measurements for the cable assembly types (see Annex 179D) are made between TP1 and TP4 with cable assembly test fixtures at both ends. Each such test fixture has an MDI receptacle compatible with the MDI plug at the end of the cable assembly, a coaxial connector for each lane suitable for connection to test equipment, and a PCB connecting the lanes from the MDI receptacle to the coaxial connectors. The test fixture reference insertion loss is specified in 179B.3. The TP2 or TP3 test fixture and the cable assembly test fixture are specified in a mated state to enable connections to measurement equipment. The reference insertion loss of the mated test fixtures is 9.75 dB at 53.125 GHz using Equation (179B-5)."

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

The commenter points out that the draft never explicitly define the structures in an MCB test fixture. The proposed additional text may be better suited as an addition to 179B.3, as follows:

"The cable assembly test fixture (also known as Module Compliance Board) is required for measuring the cable assembly specifications in 179.11 and the module specifications in Annex 176D at TP1 and TP4. The test fixture has an MDI connector, and provides a high-speed electrical path between the MDI connector and the coaxial connector that defines the TP1 or TP4 test point. The TP1 and TP4 test points are illustrated in Figure 179-2."

# Text fixtures

## Comment #407, #408

### 179B.2 TP2 or TP3 test fixture

The TP2 or TP3 test fixture (also known as Host Compliance Board) is required for measuring the transmitter and receiver specifications at TP2 and TP3. The TP2 and TP3 test points are illustrated in Figure 179A-1.

**Editor's recommendation: Change the text in 179B.2 as shown below.**

The TP2 or TP3 test fixture (also known as Host Compliance Board) is required for measuring the transmitter and receiver specifications at TP2 and TP3. The test fixture has an edge connector interface that is compatible with the appropriate MDI connector on the Host board, and provides a high-speed electrical path between the MDI connector and the coaxial connector that defines the TP2 or TP3 test point. The TP2 and TP3 test points are illustrated in Figure 179A-1.

The TP2 or TP3 test fixture is also used in AUI-C2M testing for host input and output compliance. The TP2 and TP3 test points correspond to the Annex 176D test points TP1a and TP4a, respectively. The TP1a and TP4a test points are illustrated in Figure 176D-4.

Figure 176D-4—Host compliance points

NOTE 1—TP1a and TP4a correspond to the Clause 179 test points TP2 and TP3, respectively.

# Text fixtures

## Comment #407, #408

### 179B.3 Cable assembly test fixture

The cable assembly test fixture (also known as Module Compliance Board) is required for measuring the cable assembly specifications in 179.11 at TP1 and TP4. The TP1 and TP4 test points are illustrated in Figure 179-2.

**Editor's recommendation: Change the text in 179B.3 as shown below.**

The cable assembly test fixture (also known as Module Compliance Board) is required for measuring the cable assembly specifications in 179.11 and the module specifications in Annex 176D at TP1 and TP4. The test fixture has an MDI connector, and provides a high-speed electrical path between the MDI connector and the coaxial connector that defines the TP1 or TP4 test point. The TP1 and TP4 test points are illustrated in Figure 179-2.

The cable assembly test fixture is also used in AUI-C2M testing for module input and output compliance. The TP1 and TP4 test points for AUI-C2M testing are illustrated in Figure 176D-5.

Dudek, Mike		Marvell		
Comment Type	TR	Comment Status	D	PMD Mapping (E)
Annex 180A provides normative requirements for which fibers should be used when connectors are not fully utilized. Whereas for the equivalent situation for CR there is just a "recommendation" with the use of "should"				
SuggestedRemedy				
Change "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C–2 should be used." to "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C–2 shall be used"				
Proposed Response	Response Status W			
PROPOSED ACCEPT IN PRINCIPLE.				
The commenter points out the misalignment for PMD mapping requirements in the optical modules compared to the copper cables. It seems correct to strongly recommend that the lower PMD numbers be used when MDI connectors are not fully utilized, however it has never been a normative requirement in past projects.				
Consensus will be needed to make the change. For CRG discussion.				

### Text in question

An MDI connector type may support one or more PMDs. The assignment of PMD signals to connector signals is specified in Table 179C–2, where as an example 0:DL0n refers to the DL0n signal of the first PMD; see 179.8.2 and 179.8.3 for signal naming definitions. When an MDI connector is not fully utilized the lower PMD numbers in Table 179C–2 should be used.

Annex 179C is about the MDI (part of the PMD), not the cable assembly.

The suggested remedy as written would forbid, for example, a host from disabling some lanes in an 8x200G port (e.g. with OSFP connector) because in this case the MDI connector is not fully utilized.

# MDI lane mapping

## Comment #183

CI 179C	SC 179C.1	P916	L3	# 183
Dudek, Mike		Marvell		
Comment Type	TR	Comment Status	D	PMD Mapping (E)

Annex 180A provides normative requirements for which fibers should be used when connectors are not fully utilized. Whereas for the equivalent situation for CR there is just a "recommendation" with the use of "should"

### Suggested Remedy

Change "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C–2 should be used." to "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C–2 shall be used"

Proposed Response	Response Status	W
-------------------	-----------------	---

PROPOSED ACCEPT IN PRINCIPLE.

The commenter points out the misalignment for PMD mapping requirements in the optical modules compared to the copper cables. It seems correct to strongly recommend that the lower PMD numbers be used when MDI connectors are not fully utilized, however it has never been a normative requirement in past projects.

Consensus will be needed to make the change. For CRG discussion.

## Text in 180A in comparison

Figure 180A–2—Optical lane assignments for a single-row 12-position connector

When the optical MDI is only supporting a single 1-lane PMD (200GBASE-DR1 or 200GBASE-DR1-2), the optical lanes shall be assigned to the optical connector positions Tx1 and Rx1, as shown in Table 180A–2, regardless of whether fibers are populated in the remaining optical connector positions.

This text is about the case that a host does not **support** all possible PMDs of the MDI (e.g., a module that does not include optical components for some of the lanes of an MPO12 connector).

This is not the same case as in an electrical MDI (it would be equivalent to “not all lanes of an OSFP are associated with PMD Tx/Rx functions”).

As stated in the proposed response, there was never a normative requirement for CR PMDs as suggested. It is arguable whether such hosts exist and need to be addressed at all, especially with a normative statement.

## Comment #183

CI 179C	SC 179C.1	P916	L3	# 183
Dudek, Mike		Marvell		
Comment Type	TR	Comment Status	D	PMD Mapping (E)

Annex 180A provides normative requirements for which fibers should be used when connectors are not fully utilized. Whereas for the equivalent situation for CR there is just a "recommendation" with the use of "should"

### Suggested Remedy

Change "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C-2 should be used." to "When an MDI connector is not fully utilized the lower PMD numbers in Table 179C-2 shall be used"

Proposed Response	Response Status	W
-------------------	-----------------	---

PROPOSED ACCEPT IN PRINCIPLE.

The commenter points out the misalignment for PMD mapping requirements in the optical modules compared to the copper cables. It seems correct to strongly recommend that the lower PMD numbers be used when MDI connectors are not fully utilized, however it has never been a normative requirement in past projects.

Consensus will be needed to make the change. For CRG discussion.

## Current text in 179C

An MDI connector type may support one or more PMDs. The assignment of PMD signals to connector signals is specified in Table 179C-2, where as an example 0:DL0n refers to the DL0n signal of the first PMD; see 179.8.2 and 179.8.3 for signal naming definitions. When an MDI connector is not fully utilized the lower PMD numbers in Table 179C-2 should be used.

## Text in 180A in comparison

When the optical MDI is only supporting a single 1-lane PMD (200GBASE-DR1 or 200GBASE-DR1-2), the optical lanes shall be assigned to the optical connector positions Tx1 and Rx1, as shown in Table 180A-2, regardless of whether fibers are populated in the remaining optical connector positions.

## Possible change in 179C to align with 180A language:

When the electrical MDI is does not support the full number of 1-lane PMDs (200GBASE-CR1) shown in Table 179C-2, the lanes [should/shall] be assigned to the lower connector positions.

Editor's recommendation: AIP; Choose between

- Change the text in 179C as shown on the right, keeping "should".
- Change the text in 179C as shown on the right, changing to "shall".
- Delete the sentence.

CI 179 SC 179.9.4.9 P432 L8 # 177

Dudek, Mike

Marvell

Comment Type T Comment Status D RLdc (E)

Equation 179-13 didn't get changed correctly per the resolution to C2.1 comment #169. (It was changed to the requirement for the mated test fixture not the TP2 point. Figure 179-5 does not match the equation and appears to be correct.

### Suggested Remedy

Make equation 179-13 match equation 179-20 (but the parameter is correctly RLdc not RLcd)

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

The comment correctly points out an incorrect implementation of the resolution of comment #169 against D2.1, which refers to slide 3 of the contribution

<[https://www.ieee802.org/3/dj/public/25\\_09/ghiasi\\_3dj\\_03a\\_2509.pdf](https://www.ieee802.org/3/dj/public/25_09/ghiasi_3dj_03a_2509.pdf)>.

The equation was incorrectly changed to the proposed equation for the mated test fixtures (identical to equation 179B-8), instead of the proposed equation for TP2/TP4.

Change Equation 179-13 to the following:

$RLdc(f) \geq \begin{cases} 23-22(f/106.25), & 0.05 \leq f < 53.125 \\ 12, & 53.125 \leq f < 67 \end{cases}$

## Equation 179-13 (transmitter RLdc) as of D2.2

### 179.9.4.9 Common-mode to differential-mode return loss

The transmitter common-mode to differential-mode return loss shall meet Equation (179-13) as illustrated in Figure 179-5.

$$RLdc(f) \geq \begin{cases} 26 - 22 \frac{f}{106.25} & 0.05 \leq f < 53.125 \\ 15 & 53.125 \leq f < 67 \end{cases} \quad (179-13)$$

## Is identical to Equation 179B-8 (Test fixture RLdc)

$$RLdc(f) \geq \begin{cases} 26 - 22 \frac{f}{106.25} & 0.05 \leq f < 53.125 \\ 15 & 53.12 \leq f < 67 \end{cases} \quad (179B-8)$$

This is an error. To match Figure 179-5 (which is correct), the equation should be the same as Equation 179-20 (which is for RLcd).

## Proposed change to Equation 179-13:

$$RLdc(f) \geq \begin{cases} 23 - 22 \frac{f}{106.25} & 0.05 \leq f < 53.125 \\ 12 & 53.125 \leq f < 67 \end{cases} \quad (179-13)$$
