#### Comment Status D Comment Type T

The large number of connections based on EFM that will exist in the future makes it very advisable to apply power management procedures (copper & optical fiber) in order to eliminate "ghost power", because the average use of this connections is less than 5 hours/day (< 20% of the total time). For example, with 200 million users, the energy saving would be of the order of 14 TWh/year, equivalent to 1,4 Billion € (<>1,75 Billion \$).

### SuggestedRemedy

There is a power management specified in Std 802.11-1999, Clause 11, Subclause 11.2, that will serve as a basis to implement the control via the OAM protocol or with a specific procedure. In order to reduce the power consumed by the equipment, diverse components of these equipment can become disconnected during periods of inactivity.

Applying power management to all the Ethernet equipment (not only EFM) would result in a huge energy saving, due to the high number of devices that use this technology.

Comment Type T Comment Status D

It is very important for Ethernet over voice-grade copper connections to supply power either from the Central Office (CO) like in the European ISDN, or from the switch/hub in LANs. This feature would have many advantages, not only for service providers, but also for users of 10PASS-TS or 2BASE-TL in LANs and campus networks: since it enables users to connect remote devices. For example, the cameras used in video-monitoring systems would need only one pair to transport the signal and the power, rather than the four pairs specified now in 802.3af. This would increase the link length from 100 m to 2 km.

### SuggestedRemedy

The specifications of 802.3af should be extended to include voice-grade copper, in order to make the changes required.

Clause 31 should be modified to something like this: "DTE powering is intended to provide both data transfer and power feed to 10BASE-T, 100BASE-TX, 1000BASE-T, 10PASS-TS or 2BASE-TL devices".

As a reference, the ISDN and HDSL connections in Europe supply power from CO to the CPEs through POTS cables.

Comment Type TR

Are we sure we haven't messed up the legacy Ethernet?

This rather vague comment is to replace an old TR which was triggered by counters(?) which fouled up regular Ethernet, and I've submitted it to encourage all readers to consider if the implications of the changes and additions in EFM could cause an unintended issue to existing Ethernets, including 10G Ethernet.

SC

SuggestedRemedy

Check list: Counters and registers still OK for legacy Ethernet? Management stuff still OK? 100BASE-LX10 and 1000BASE-LX10 not tied to any public-networks-specific requirements? No damage to 10G? No outlawing current MAC, RS, PCS, PMAs in subscriber access networks? Other? Proposed Response Response Status U

REJECT.

The commenter is encouraged to file a suggested remedy.

Cu duplex D3.0 #500

C/ 00	SC	Р	L	#	99302
Grow, Rob	ert	Intel			

Comment Type TR Comment Status A

Full-duplex is not used correctly. A section that illustrates this well is 56.1 (bottom of page 158). P2MP does not use full duplex links -- it is a passive star.

EFM copper confuses the existing uses of full-duplex and half-duplex (see 1.1.1, 1.1.1, 1.1.1.2, 1.4.135, 1.4.139, 4.1.1, 4.1.2.1.1, etc.) In the published standards, full-duplex text generally is written with the assumption that CRS and COL do not need to be implemented in full duplex mode.

Similar terms are used interchangably or linked. For example "full duplex" as shorthand for "full duplex mode", (802.3ah, page 24 line 13 and 17), full duplex link (802.3, 4.1.1) and full duplex operation being synonomous with full duplex mode(802.3, 4.1.1) and MAC full duplex mode linked with an underlying full duplex PMD link ).

### The base

### SuggestedRemedy

Harmonize use of full duplex and half duplex with the published standard. I believe this requires a full search of the base documents to make sure text does not contradict functionality exploited by EFM.

Most of the conflicts with EFM copper uses will require base document changes.

I believe full duplex and half duplex should not be used in P2MP descriptions except for describing full duplex emulation or when specifically referencing a mode as described in the base document.

Proposed Response Response Status U

ACCEPT IN PRINCIPLE.

The first paragraph of the comment is factually incorrect. P2MP does not use a passive star topology like 10BASE-FP.

P2MP does provide simultaneous full duplex transmission on a single strand of fiber via wavelength division multiplexing.

### Regarding the second paragraph,

On p 318, line 50, change "full duplex operation" to "simultaneous transmission and reception without contention".

Check other instances of full or half duplex in clause 61 and reference Annex 4A wherever reference is made to the full-duplex MAC.

The third paragraph of the comment does not cite any errors or deficiences in the draft as it refers to material that is unchanged from the base standard.

Comment	Туре	TR	Comment Status	Α		ALL D3.0 #528

Inappropriate uses of error rate.

#### SuggestedRemedy

Search for error rate and replace with error ratio to be consistent with similar change implemented by IEEE Std 802.3aj-2003.

Proposed Response Response Status U ACCEPT IN PRINCIPLE.

Where the quantity is errors per bit change to ratio. Where the quantity is error per unit time then it can remain as rate.

C/ 00	SC	Р	L	# 3	74
Thompson, (	Geoffrey	Nortel			

Comment Type TR Comment Status D

I continue to believe that many of the technically sound concepts included in this proposal, while suitable for the access market, are fundamentally at odds with the underlying principals of Ethernet embodied in IEEE Std 802.3 to date. While we have made changes in the past they have been all realativley minor and most of them have worked out. Some, in retrospect, while they seemed like a good idea at the time have set bad precedents for later work. Across it all Std 802.3 has remained conceptually pretty consistent. P802.3ah has several significant departures from that conceptual consistency. I believe that the precedents they set will cause significant confusion over the long term and destroy the conceptual consistency of Ethernet as it is known.

The specific areas that concern me most are:

Loss of the peer relationship to a provider - customer asymmetry Unidirectional transport

Loopback

New non CSMA/CD mechanisms for shared media access arbitration. OAM mechanism that are not consistent with the earlier Management Low speed operation not consistent with prevalent perception of Ethernet. The requirement for and complexity of ranging & discovery protocols Requirement for additional levels of station addressing

### SuggestedRemedy

Revise the PAR and the draft so that what is currently designated as P802.3ah can be approved as a separate full/new standard that is approved as and will remain a separate standard from IEEE Std 802.3. This will allow this project and its provider oriented successors/amendments to more freely meet the requirements of this significantly different marketplace and set of customers.

Pursue further steps to approval, both editorially and procedurely as a separate standard.

Comment Type TR Comment Status A D3.0 #747 Subclause is unclear and contains data that is either duplicated or belongs in another clause.

#### SuggestedRemedy

Move the last sentence of the last paragraph to be the last sentence of the first paragraph.

Move the second paragraph to proceed the first paragraph. Move MF42 & MF43 in PICS to proceed MF38 & MF39.

Delete the third paragraph and delete MF40 & MF41. This information should be in those respective clauses and repetition here just requires editing if another standards development wishes to use this bit.

Proposed Response Response Status U

ACCEPT IN PRINCIPLE.

I agree with all the moves.

The third paragraph was added to resolve a TR in WG ballot that expressed concern about enabling this capability without consideration of the ramifications.

Comment Type T Comment Status D

I'm puzzled by this counter. It will count detectably errored code-groups within frames - I don't think it counts errored idles (not sure about errored /C/? We already have a FrameCheckSequenceErrors counter which will count once per errored frame (max approx 15000 bits on the line or 90000 for RPR). If we had more than one error per frame except very occasionally, the error rate (after any FEC) would be approx 10^5 or worse - we don't need to know how much worse.

Also this counter will miss many 4B/5B errors, as the 4B/5B code doesn't have very good error detection. It will miss some 8B/10B errors. But a total of the FCS check counter plus the other frame-oriented counters e.g. aAlignmentErrors will catch them. So for half-way usable or good links, aPCSCodingViolation will under-estimate the number of errors. Further, this counter will run up to silly numbers on a burst, masking any information about the quality of the link.

And it makes the management of different speeds more different than it need be, as this counter seems to apply to some but not all port types.

#### SuggestedRemedy

If this counter is needed for anything (maybe it is needed for 10P/2B?) then explain, and give a reference, and reconsider how it interacts with FEC. Also add a throttle, at least optionally: could say that counting one for any block of 1000 octets is acceptable (SONET uses block checking), as is ignoring up to 1000 octets after an error (ESCON uses this blanking method).

If the counter is not needed, get rid of it.

Cl 57	SC 57.4.3.1	P 196	L16	#	99320
James, Davi	d	JGG			

Comment Type TR Comment Status R

The need for uniqueness of an OUI based identifier is best met by utilizing the EUI-48 or EUI-64 definitions, so that each organization doesn't have to understand the context when assigning such numbers to the requesting division.

#### SuggestedRemedy

Revise the OUI and following data, so that this starts with an EUI-48 or EUI-64 value. Otherwise, multi-division organizations will have to define their own subparsing conventions, which is prone to error (some have already happened with Japanese vendors and parts of 1394/AVC that do this type of thing).

Proposed Response Response Status U

REJECT.

Governance of the internal behavior of multi-division organizations is entirely out of scope of the IEEE standards activities.

See also response to comment #735.

C/ 57	SC 57.4.3.1	P 196	L <b>24</b>	# 99321
James, Davi	d	JGG		

Comment Type TR Comment Status A

The IEEE/RAC defines OUIs as HEX values. Given the confusion between leftmost being first, or the first transmitted bit being first, any descriptions in terms of bits and/or bit ordering should be removed.

#### SuggestedRemedy

Eliminate the binary text: the hex values are sufficient.

Proposed Response Response Status U ACCEPT IN PRINCIPLE.

See comment #736, which removes the bit ordering example.

SuggestedRemedy         Change to a Path Penalty Test with a minimum specified amount of dispersion in the test fiber.         Proposed Response       Response Status       U	SuggestedRemedy Change Clause title to: 61. Physical Coding Sublayer (PCS), Transmission Convergence (TC) sublayer, and common specifications, type 10PASS-TS and type 2BASE-TL
REJECT. TDP is a dispersion based path penalty test and is the more comprehensive of the two. If it were substituted by path pealty, then additional tests would have to be adderd. TDP testing has been under development for ~3 years in 10G and is accepted in this community. An alternative testing mechanism would need considerable scrutiny before it could be implemented.	Proposed Response     Response Status     O       C/ 61     SC 61.1     P 354     L 20     # 376       Beili, Edward     Actelis Networks

TDP D3.0 #298	The draft text calls the CO - "centralized distribution equipment" and CPE - "line termination equipment owned or controlled by a subscriber ". In the xDSL world (see ITU-T 993.1 and 995.1 for example) the CO side is called Line Termination (LT) and the CPE side is called Network Termination (NT). In addition in some cases the CPE may be owned and controlled by an operator (carrier).
SuggestedRemedy         Change to a Path Penalty Test with a minimum specified amount of dispersion in the test fiber.         Proposed Response       Response Status         U         REJECT.	SuggestedRemedy Replace lines 20-21 with: "between centralized line termination equipment, such as a Central Office (CO), and network termination equipment at the remote customer premises (Customer Premises Equipment, CPE)."

Surprisingly, nowhere in the draft is there a statement of which RS the 2BASE-TL and 10PASS-TS PHYs connect to. Even if the editors believe that it's 'obviously' clause 22, that doesn't mean it's the case: one would not obviously expect low-speed PHYs to use the 10G MDIO clause 45, but they do. Or, there could be new PHY-specific RSs for these PHYs. Further, if it's clause 22, can I run it at 10 Mb/s for 10PASS-TS? I can't tell from this draft.	Comment Type E Comment Status D term 3.4.1. is not a register, it is a bit SuggestedRemedy change text to 'parts of register 3.4'
SuggestedRemedy	Proposed Response Response Status O
Whatever the situation is, explain it at appropriate length in 61, and provide the chief editor with a single sentence for the end of 56.1.2.2. Correct and better my suggestion: 'EFM electrical {links connections} use the reconciliation sublayer of clause 22 operating at {10 100} Mb/s.' Thanks!

Cleardown condition not correct. Aggregation has 3 different stage, and each link can be in a different stage. Between the stages there might be some breaks where no actions takes place on this link (none of the 3 mentioned bits set). In this breaks no clear down process shall be started

### SuggestedRemedy

Remove entire sentence, see different comment which is asking for dedicated clear down bit in register 45.1.30 (chapter 45.2.11)

Proposed Response Response Status 0

C/ 61	SC 61.6	P 400	L17	# 209
Beck, Micha	ael	Alcatel Bell nv		

Comment Type TR Comment Status D

61.6, "MDI specifications", states that "local regulations may dictate interface characteristics in addition to or in place of some or all of these requirements".

61.8. "Environmental specifications", states that "the specific requirements of the network operator or the local authority having jurisdiction shall prevail in all cases".

These statements override the specific requirements of Clause 62 and Clause 63, and may impact the performance of EFM Copper systems. There is no text to warn the implementer/user that this may result in non-compliance with this standard.

### SuggestedRemedy

Add the following informative text to 61.7 "System considerations"

NOTE---It is recognized that an EFM Copper system may have to comply with additional requirements and/or restrictions outside the scope of this standard (see 61.6 and 61.8 for examples) in order to be allowed to be connected to a public infrastructure in a certain geographic area or regulatory environment. These additional requirements and/or restrictions may prohibit operation under certain profiles, or degrade the performance of the system when working under certain profiles. If this is the case, the system is not compliant with this standard, as compliant systems support all profiles (see Annex 62A for 10PASS-TS and Annex 63A for 2BASE-TL) and meet all performance guidelines (see Annex 62B for 10PASS-TS and Annex 63B for 2BASE-TL).

A compliant CPE-side system cannot distinguish a CO-side system designed to operate under a limited set of profiles from a fully compliant CO-side system, as the selection of profiles is under control of the CO-side. A CPE-side system designed to operate under a limited set of profiles cannot be guaranteed to correctly interoperate with compliant COside systems.

It is recommended that vendors of systems that support a limited set of profiles provide PICS forms to indicate which profiles are supported, in order to allow users to assess the impact on interoperability.

Proposed Response Response Status **O** 

only in the wrong place

### SuggestedRemedy

Change 'Both EFM Copper port types are only defined for full duplex operation,' to 'Both EFM Copper port types are defined for full duplex operation only,'.

SC 64.2.2

C/         64         SC         64.2.2.2         P 459         L 48         # 572           Cravens, George         Mindspeed         Mindspee	C/         64         SC         64.2.2.3         P 461         L 24         # 138           Brown, Benjamin         Independent         IndepIn100000000000
Comment Type       T       Comment Status       D         The "existance of a more accurate timebase" needs to be defined more clearly.         As Figure 64-11 shows, the localTime variable is reloaded with the received timestamp value for every MAC Control Frame with a timestamp opcode.	Comment TypeTRComment StatusDThere are several instances where states are referred to. Here is one, referring to the TransmitFrame state. Page 462, line 2, refers to the forwarding state as does page 484, line 38. Are these real states? What state diagram (or anything else) does this refer to? I searched for these states and couldn't find them
The last sentence also seems to contradict Figure 64-11, since the value of the variable may change any time a MAC Control Frame with the timestamp opcode is received, so "highly undesirable and unspecified" seems like a rather nasty feature.	SuggestedRemedy         Be more specific about what state diagram is being referenced or change the wording to not imply particular states.         Proposed Response       Response Status         O
If changing the localTime variable can cause "highly undesirable and unspecified" behavior, then the ONU Control Parser state machine (figure 64-11) must be changed to prevent such an occurance.	C/ 64 SC 64.2.2.3 P461 L3 # 545
SuggestedRemedy Change the sentence starting on line 48 ("It is periodically") to the following: It is reloaded with the received timestamp value (from the OLT) by the Control Parser (see Figure 64-11).	Lynskey, Eric UNH-IOL <i>Comment Type</i> <b>E</b> <i>Comment Status</i> <b>D</b> The timestampDrift variable is defined as a boolean, so it cannot take on an actual value. The last sentence should be deleted.
Proposed Response Response Status O	SuggestedRemedy Remove the sentence "The timestampDrift value is represented in units of time_quanta."

Each of these primitives is followed by a list of parameters not operand lists. I debated over suggesting a major rewording of this section so that rather than define each primitive multiple times, you simply reference the primitive in 2.3.3.2 then here describe only the operand lists for each opcode. I decided not to push this as I think what you have here is adequate. However, since you are describing service primitives, the items in each primitive are parameters not operand lists.

#### SuggestedRemedy

C/ 64

Brown, Benjamin

Comment Type

SuggestedRemedy

For each primitive here, in 64.3.4.5 and 64.3.5.5, replace "This primitive takes the following operand list" with "This primitive takes the following parameters"

Comment Type T Comment Status D

Is the OLT Control Multiplexer really intended to filter transmit frames to prevent unsupported opcodes from being transmitted?

This seems very wrong, and may cause major headaches in the future since this would prevent a compliant design from ever supporting any new opcodes. Since PICS entry SM4 makes compliance mandatory, a "user friendly" design that allows upper layers to send whatever opcodes they desire would be non-compliant.

Also, if the filtering function is to remain, how is the errant frame flushed? It seems that simply returning to the Init state without setting transmitinProgress true and doing a dummy TransmitFrame() may cause undesirable results (a clogged MAC client).

This is potentially very broken, and probably deserves a TR comment, but I'll call it a "T".

## SuggestedRemedy

Either:

1) (MUCH preferred) Delete the condition "(supported opcode)" from the two exit transitions from the PARSE OPCODE state.

or:

2) (Seems ungood) Make sure that when the Control Multiplexer filters transmit frames (based on opcodes), that the handshaking is done properly so that the offending frame is not stuck in the MAC client.

Also, if Tx frames are going to be dropped, an error must be signalled/counted somewhere (silently dropping frames is VERY bad and REALLY annoys those who have to debug the system), and a NOTE should be added to make it very clear that this is the intended (and in fact, mandated) behavior of the device.

Comment Type **TR** Comment Status **D** 

Unidirectional is of very minor use even for OAM. It doesn't 'support subscriber access networks', they'll work without it. In general it duplicates PHY layer mechanisms that will do a better job of protection switching, being hardware oriented and so can be faster. It can't work on some PHYs so it's not as generic as hoped. But maybe having both mechanisms is useful for managing complex multi-hop networks - which can exist in "traditional campus/industrial/core/metro markets too. There's nothing 'subscriber access' specific about this need.

100BASE-X optical has a suitable remote fault indication (FEFI) already, and 100BASE-LX10 type ports have been shipping for years. Let's not foul it up with a new feature, which itself need not be mandatory.

## SuggestedRemedy

Change 'This subclause specifies changes to the 100BASE-X PCS and PMA for support of subscriber access networks.' to

'This subclause specifies optional variations to the 100BASE-X PCS and PMA for unidirectional transport of OAM frames.'

We should not talk about 'changes to the existing': clause 24 isn't changing, and when this draft standard is ratified, clauses 24 and 66 will both be 'existing' on an equal footing. It doesn't seem right to call mainstream Ethernet 'legacy' as if it's losing market traction and is going to be replaced by ATM or EFM or something.

## SuggestedRemedy

Change 'These are changes to the existing 100BASE-X PCS and PMA for legacy ethernet as described in Clause 24.'

to: 'These are variations on the 100BASE-X PCS and PMA defined in Clause 24.'

Proposed Response Response Status **O**

Comment Type E Comment Status D

Re 'transmit data from the MII' could be misleading: as the PCS has an MII, if it transmits from the MII, the PCS is transmitting towards its own MAC. Remember the semantic difficulty with XAUI 'transmitting' in two directions.

SuggestedRemedy

Delete 'from the MII'. Similarly 'from the GMII' in 66.2.2.

I believe that the current organization of the text is confusing to many who are not intimately familiar with 10BASE-T.

Having the text in a single paragraph confuses that the functions of collision detection and transmit disable are a single function rather than 2 entirely separate functions.

Insert a paragraph split as indicated below.

#### SuggestedRemedy

"Collision detection is implemented by noting the occurrence of carrier receptions during transmissions, following the model of 10BASE-T. The indication of link\_status ..."

SHOULD BE SPLIT INTO TWO PARAGRAPHS, I.E.:

"Collision detection is implemented by noting the occurrence of carrier receptions during transmissions, following the model of 10BASE-T.

The indication of link\_status..." (A Maint Request has been entered to fix this in the current standard.)

Proposed Response Response Status O

Dawe, Piers		Agilent		

Comment Type TR Comment Status D

If we agree that OAM frames indicating remote fault embedded in PHY layer RF are good, or acceptable, for 10G then the same is true for 100BASE-X, except it's called FEFI rather than RF.

I do think that fast, hardware oriented, already standardized, protection switching will be needed in access networks in particular to carry time-sensitive traffic like voice and video, especially on the slower link types.

As FEFI is optional, the remedy below behaves as the current draft 3.1 when FEFI is turned off. Conveniently, 100BASE-FX doesn't have auto-negotiation. Not sure if we need a whole nibble of guard band (see suggested remedy); willing to optimise that.

## SuggestedRemedy

Change 'Far-End Fault Generate simply passes tx\_code-bits to the TX process when signal\_status=ON or when mr\_unidirectional\_enable=TRUE. When signal\_status=OFF and mr\_unidirectional\_enable=FALSE, it repetitively generates each cycle of the Far-End Fault Indication until signal\_status is reasserted or mr\_unidirectional\_enable is set to TRUE.' to:

'Far-End Fault Generate simply passes tx\_code-bits to the TX process when signal\_status=ON. When signal\_status=OFF and mr\_unidirectional\_enable=FALSE, it repetitively generates each cycle of the Far-End Fault Indication until signal\_status=OFF and mr\_unidirectional\_enable=TRUE, it repetitively generates each cycle of the Far-End Fault Indication until signal\_status=OFF and mr\_unidirectional\_enable=TRUE, it repetitively generates each cycle of the Far-End Fault Indication, interrupted by any frames, until signal\_status is reasserted. There is least one nibble (5 bits on the line) of ONEs between a ZERO in the Far-End Fault Indication stream and the start of stream delimiter to avoid error propagation'. Change the Far-End Fault Generate state diagram accordingly.

Proposed Response Response Status **0** 

C/ 66	SC 66.2.1	P 542	L <b>41</b>	# 347
Dawe, Piers	;	Agilent		

Comment Type TR Comment Status D

Similarly to one of my comments against 66.1.1: Unidirectional is less valuable than avoiding retrospective changes, allowing 1000BASE-LX10 to be used in traditional Ethernet, allowing CO Ethernet equipment to straddle the divide between traditional Ethernet and access Ethernet, not fragmenting the market, and not causing possible interoperability problems. This new way of signaling RF has to be optional and should not if practicable foul up the existing way. Also, stating the much less contentious proximate technical reason for these proposed changes.

## SuggestedRemedy

Change 'This subclause specifies changes to the 1000BASE-X PCS for support of subscriber access networks.' to

'This subclause specifies optional variations to the 1000BASE-X PCS for unidirectional transport of OAM frames.'

We should not talk about 'changes to the existing': clause 36 isn't changing, and when this draft standard is ratified, clauses 36 and 66 will both be 'existing' on an equal footing. It doesn't seem right to call mainstream Ethernet 'legacy' as if it's losing market traction and going to be replaced by ATM or EFM or something. Also, should give clause 37 a mention.

#### SuggestedRemedy

Change 'These are changes to the existing 1000BASE-X PCS for legacy ethernet as described in Clause 36.'

to: 'These are variations on the 1000BASE-X PCS defined in Clause 36 and Clause 37.'

Proposed Response Response Status **O** 

C/ 66	SC 66.2.1	P 542	L <b>43</b>	#	350	
Dawe, Piers		Agilent				

Comment Type TR Comment Status D

Need to add a statement saying when this mode or type is applicable. It can't be required for 1000BASE-LX10, there's too much stuff out there. If it causes an interop problem, it shouldn't be allowed on 1000BASE-LX10 because that's meant to be connected to 1000BASE-LX.

## SuggestedRemedy

Add sentence 'They are optional for P2P 1000BASE-X PHYs, mandatory for 1000BASE-PX-D and optional but to be used with caution for 1000BASE-PX-U.' or: 'They are optional for 1000BASE-LX10 and 1000BASE-BX10, mandatory for 1000BASE-PX-D, optional but to be used with caution for 1000BASE-PX-U and not applicable to other PHY types.' or: 'They are optional for 1000BASE-BX10, mandatory for 1000BASE-PX-D, optional but to be used with caution for 1000BASE-BX10, mandatory for 1000BASE-PX-D, optional but to be used with caution for 1000BASE-PX-U and not applicable to other PHY types.'
