

# **Details of PHY OAM in 1000BASE-X**

R0-4  
June25-2002  
Ben Brown

IEEE802.3ah EFM Task Force  
June 2002

# TX Requirements

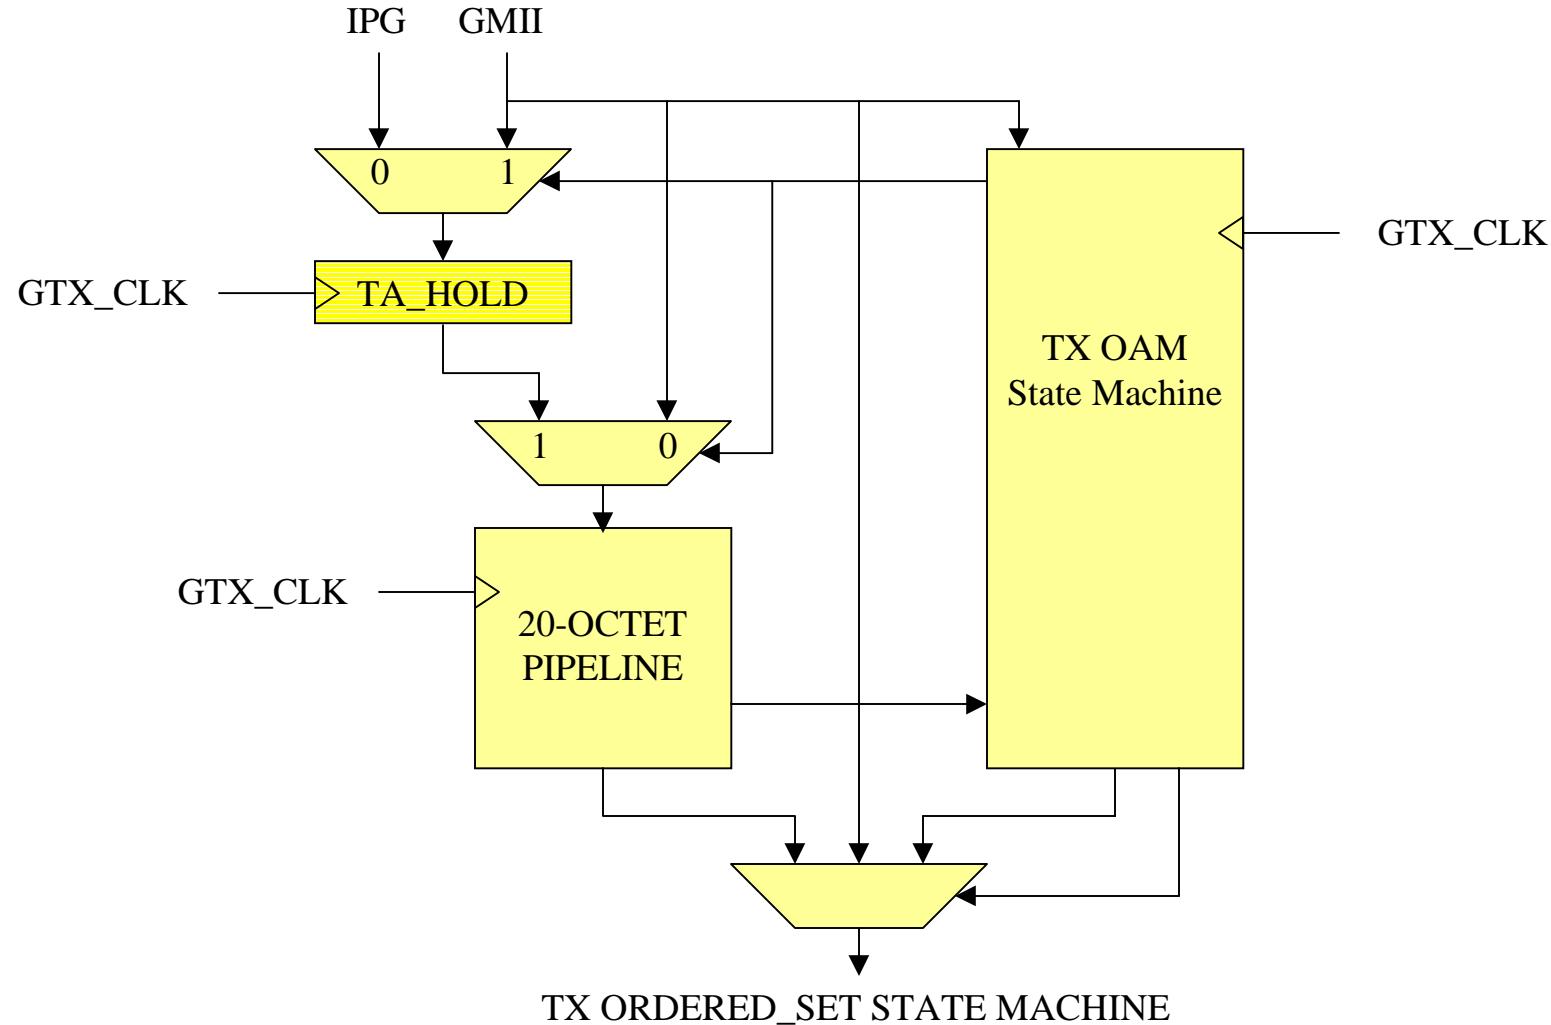

- Pipeline for “OAM Preamble Only” insertion
- Pipeline depth is 20 octets
- Alignment to TX\_EVEN at SOP
- Preamble replacement with “OAM Preamble Normal Frame”
- Idle replacement with “OAM Preamble Only”

# **Alignment to TX\_EVEN at SOP**

---

- Use a Deficit Idle Count concept as in 46.3.1.4, option 2, with the modification of limiting the maximum value to 1 rather than 3.
- First byte of packet (preamble) is written to pipeline when TX\_EVEN=FALSE.

# TX Pipeline Structure

# TX OAM State Machine Features

- Monitor the GMII for SOP (Rising edge of TX\_EN)
- Monitor alignment of SOP and TX\_EVEN to control the Deficit Idle Count
- Control the pipeline input and DIC octet
- Monitor the contents of the pipeline
- Monitor the request to insert an OAM Message
- Replace Preamble or IPG with OAM Message
  - Forward PHY ID in EPON mode
- Control data to TX Ordered\_Set state machine

# Preamble replacement with “OAM Preamble Normal Frame”

- Replace the 8 bytes of Preamble at the end of the pipeline under the following conditions:
  - An OAM Message is available
  - The entire pipeline is full of DATA
  - The PCS transmit ordered\_set state machine is in the XMIT\_DATA state
- Forward PHY ID in EPON mode

# **Idle replacement with “OAM Preamble Only”**

- Replace the 8 bytes of IPG at the end of the pipeline under the following conditions:

An OAM Message is available

The entire pipeline is full of IPG

The PCS transmit ordered\_set state machine is in the XMIT\_DATA state

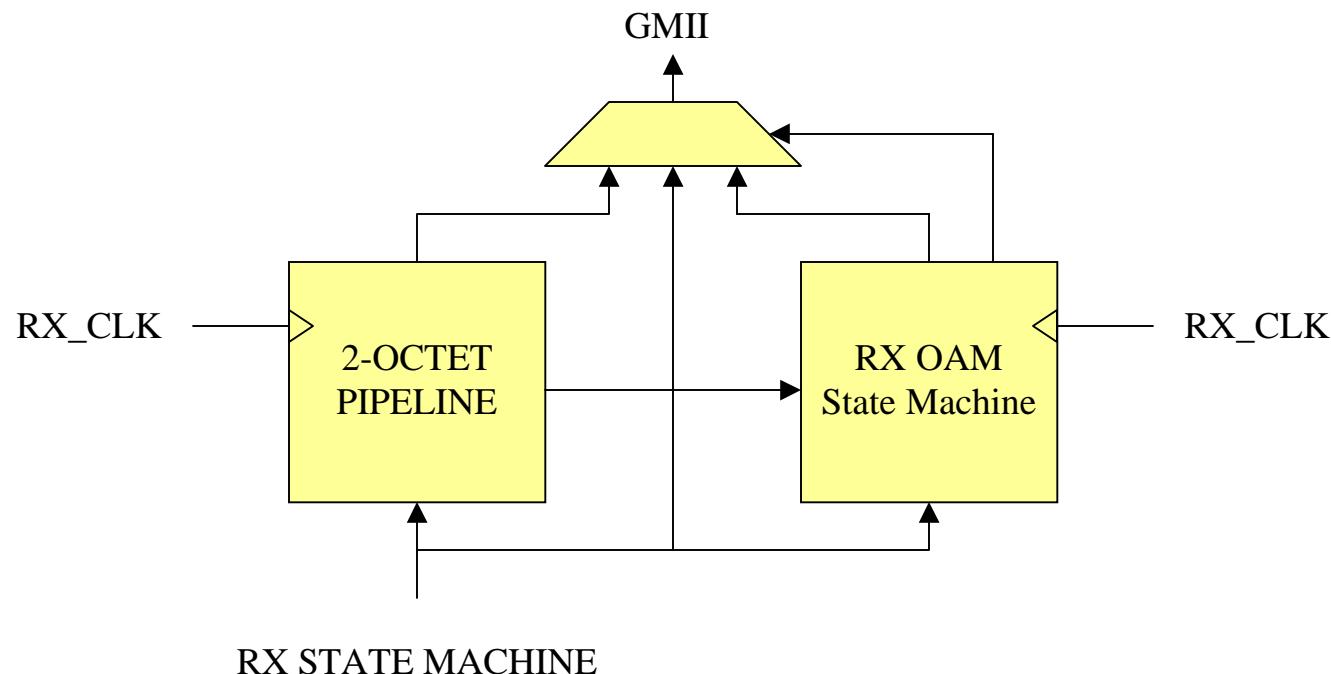

The last 12 bytes out of the pipeline were IPG

TX\_EVEN = FALSE

# RX Requirements

- Pipeline for “OAM Preamble Only” removal
- Pipeline depth is 2 bytes
- “OAM Preamble Normal Frame” replacement with Preamble
- “OAM Preamble Only” replacement with Idle
- Forward of errors
- Set RX\_ER on SFD if CRC8 is bad in EPON mode only

# RX Pipeline Structure

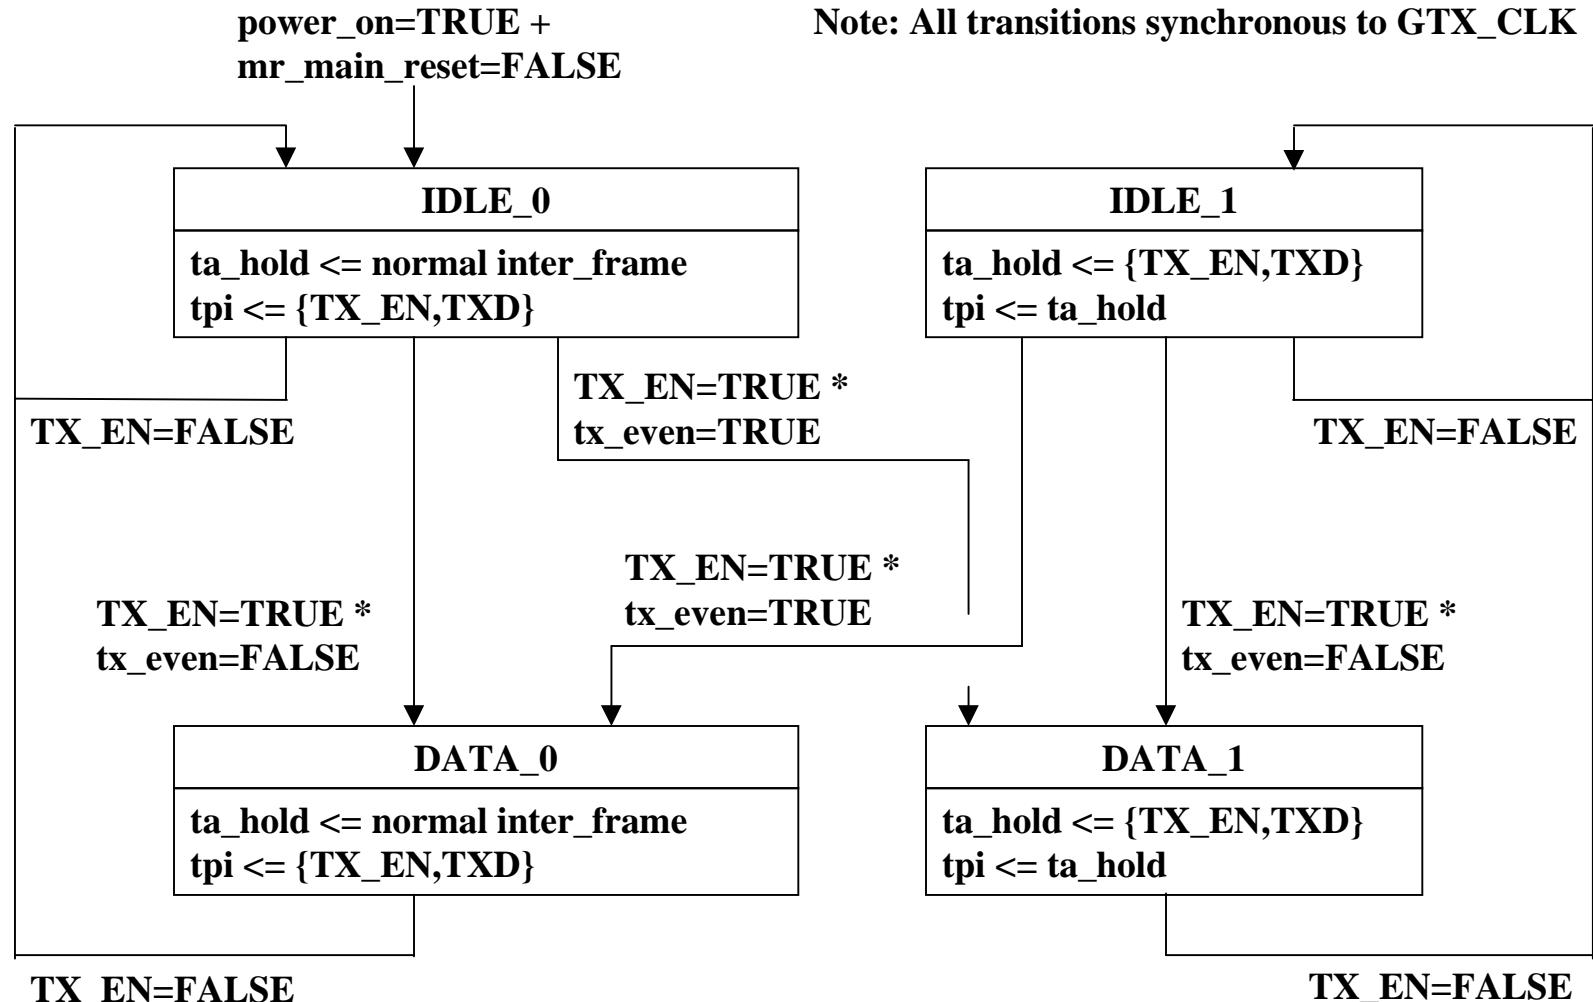

# RX OAM State Machine Features

- Monitor the contents of the pipeline
- Monitor the OAM byte for Preamble/Frame type
- Replace “OAM Preamble Only” with IDLE
- Replace “OAM Preamble Normal Frame” with Preamble/SFD
  - Forward PHY ID in EPON mode
- Extract OAM Message
- Force RX\_ER on SFD for bad CRC8 in EPON mode only
- Control data to GMII

# **State Machines, Variable & Functions**

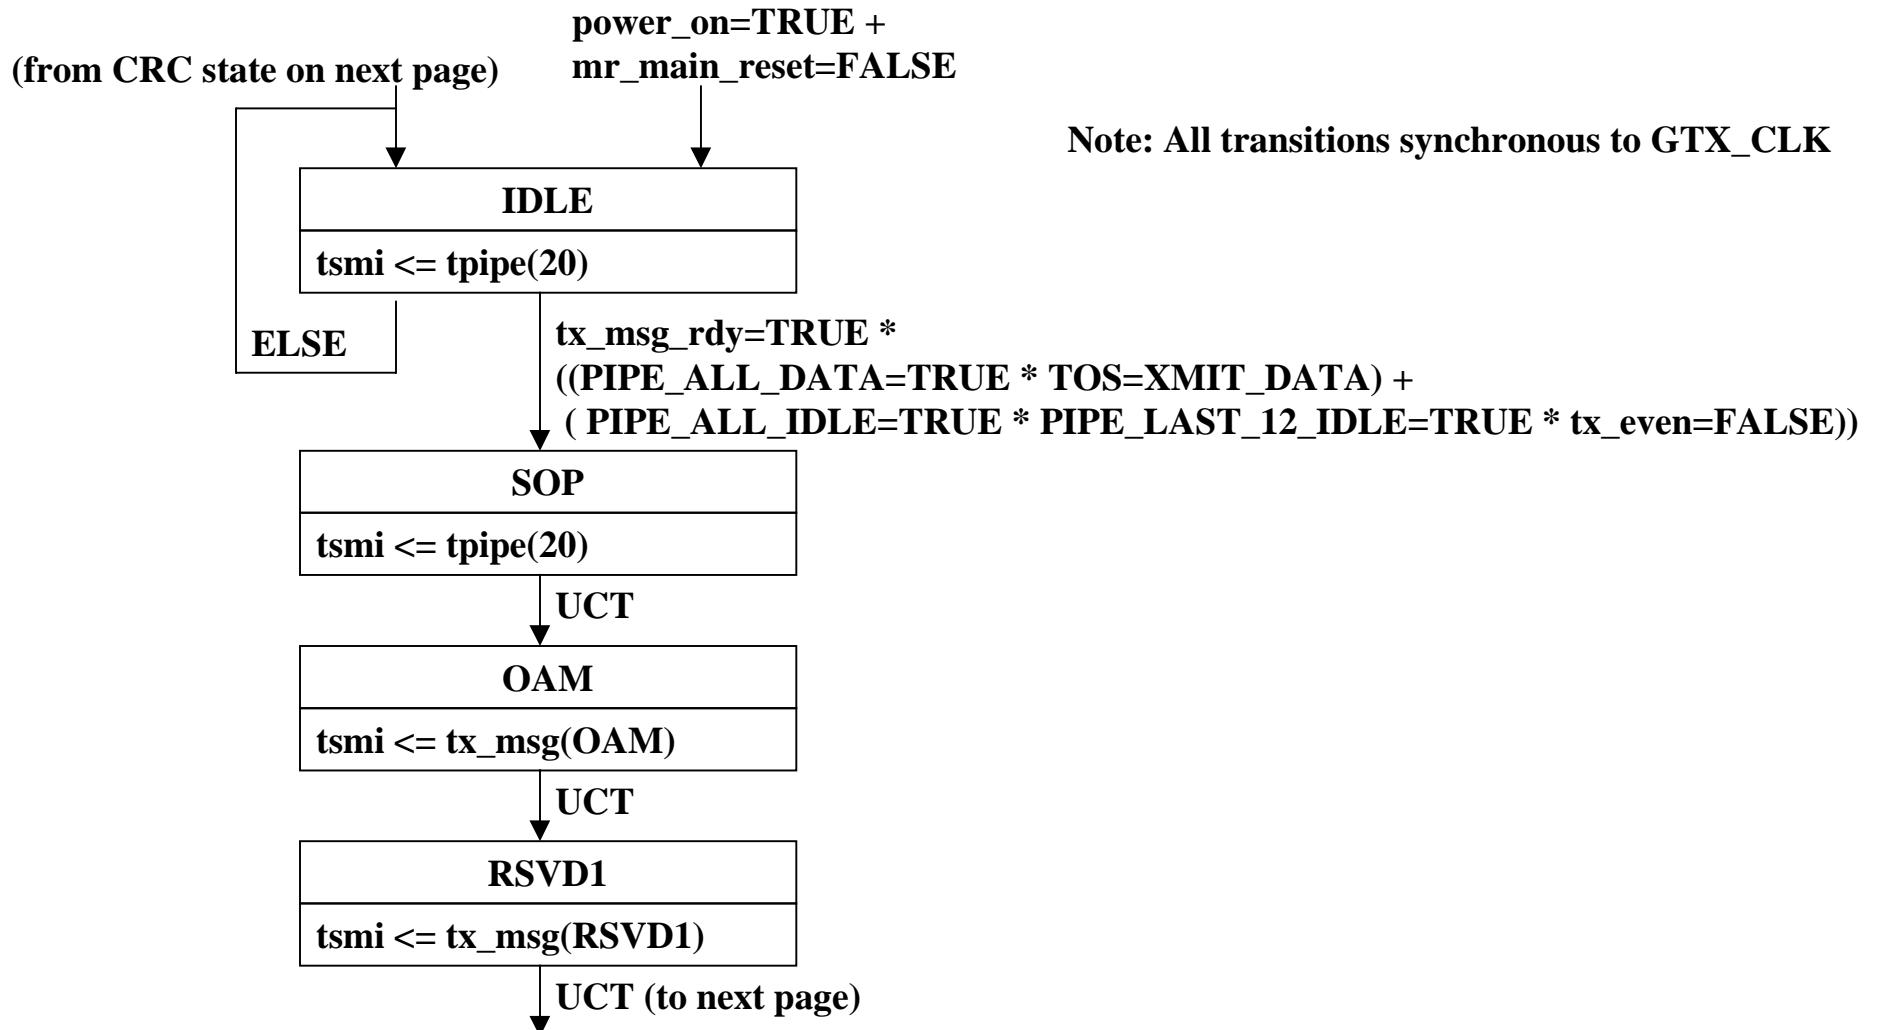

# TX\_EVEN Alignment State Machine

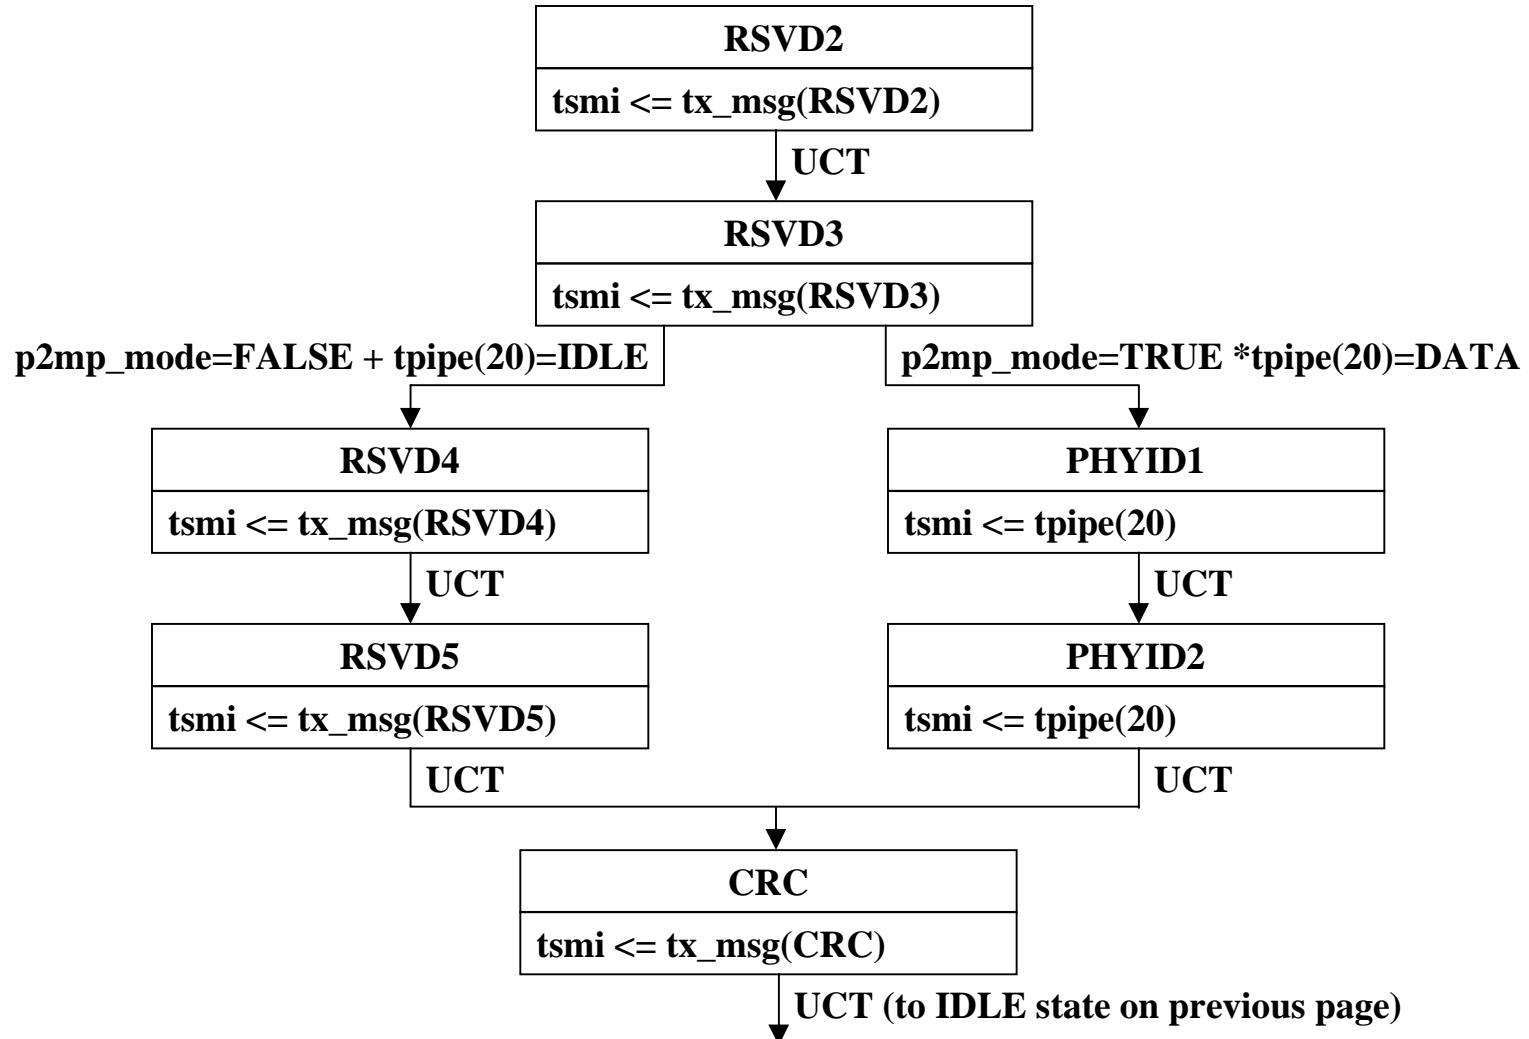

# TX OAM Variables

- **ta\_hold - Transmit Alignment Hold register**  
A 9-bit vector for storing TX\_EN & TXD<7:0> when aligning data to TX EVEN.  
Needs to reflect that this is a storage element
- **tpi - TX Pipeline Input**  
A 9-bit vector used as input to the TX OAM pipeline. It either reflects the current contents of the TX\_EN & TXD<7:0> or the contents of the TA\_HOLD register.  
Needs to reflect that this is NOT a storage element

# TX OAM State Machine (page 1)

# TX OAM State Machine (page 2)

# TX OAM Variables

- **tsmi - Transmit Ordered\_Set State Machine Input**

A 9-bit vector used as input to the transmit ordered\_set state machine. This vector is only used when Transmit OAM is enabled. Otherwise, the GMII is the direct input to the state machine.

Needs to reflect that this is NOT a storage element

- **tpipe(#)** - TX Pipeline Stage #

A 9-bit vector that reflects the contents of a particular stage of the transmit pipeline. #=1..20 where 1 is the first stage of the transmit pipeline and 20 is the last. When enabled and on every GTX\_CLK rising edge, tpipe(1) takes the value tpi, tpipe(n+1) takes the value tpipe(n) for all n>1. The reset value of tpipe(#) is normal inter\_frame.

# TX OAM Variables

- **tx\_msg(x) - TX OAM Message**
  - x consists of OAM, RSVD1, RSVD2, RSVD3, RSVD4, RSVD5, CRC**  
Contains the TX OAM message to be inserted in the place of a packet's preamble or inserted into the IDLE stream.
  - OAM - OAM byte from (insert reference here)**
  - RSVDx - RSVD bytes from (insert reference here)**
  - CRC - CRC8 of TX OAM message from (insert reference here)**

# TX OAM Functions

- **PIPE\_ALL\_DATA**

This is an indication that all 20 stages of the TX OAM pipeline contain DATA octets. That is, for each stage, the TX\_EN bit is TRUE.

- **PIPE\_ALL\_IDLE**

This is an indication that all 20 stages of the TX OAM pipeline contain IDLE octets. That is, for each stage, the TX\_EN bit is FALSE.

- **PIPE\_LAST\_12\_IDLE**

This is an indication that the last 12 octets transferred from the TX OAM pipeline to the transmit ordered\_set state machine were IDLE octets.

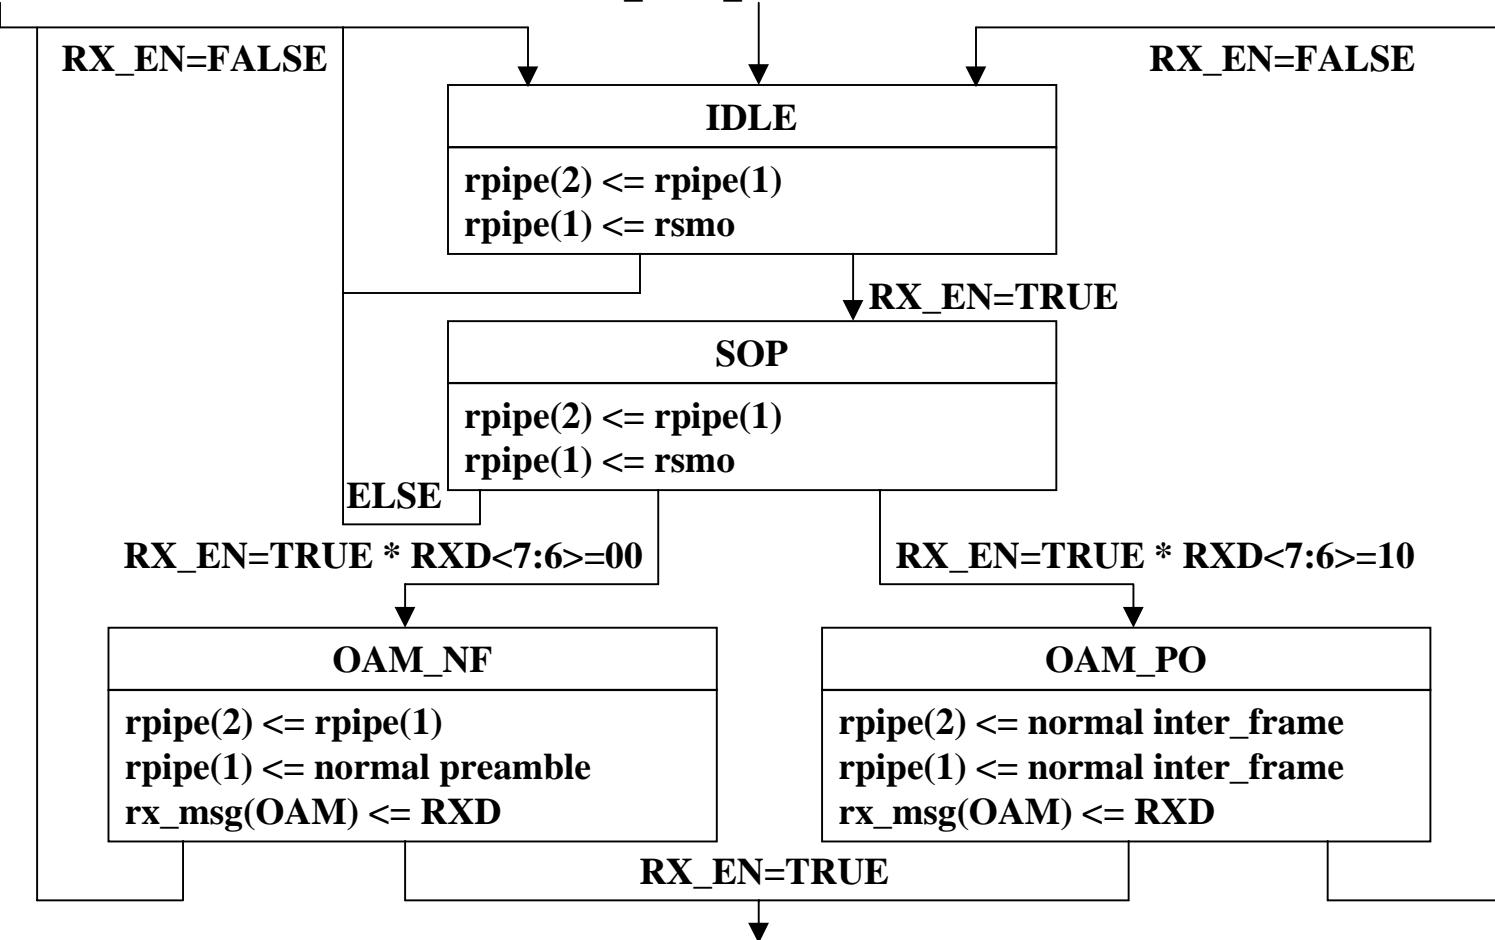

- **tx\_msg\_rdy**

A boolean indicating that a TX OAM message is available and ready to be inserted by the TX OAM state machine.

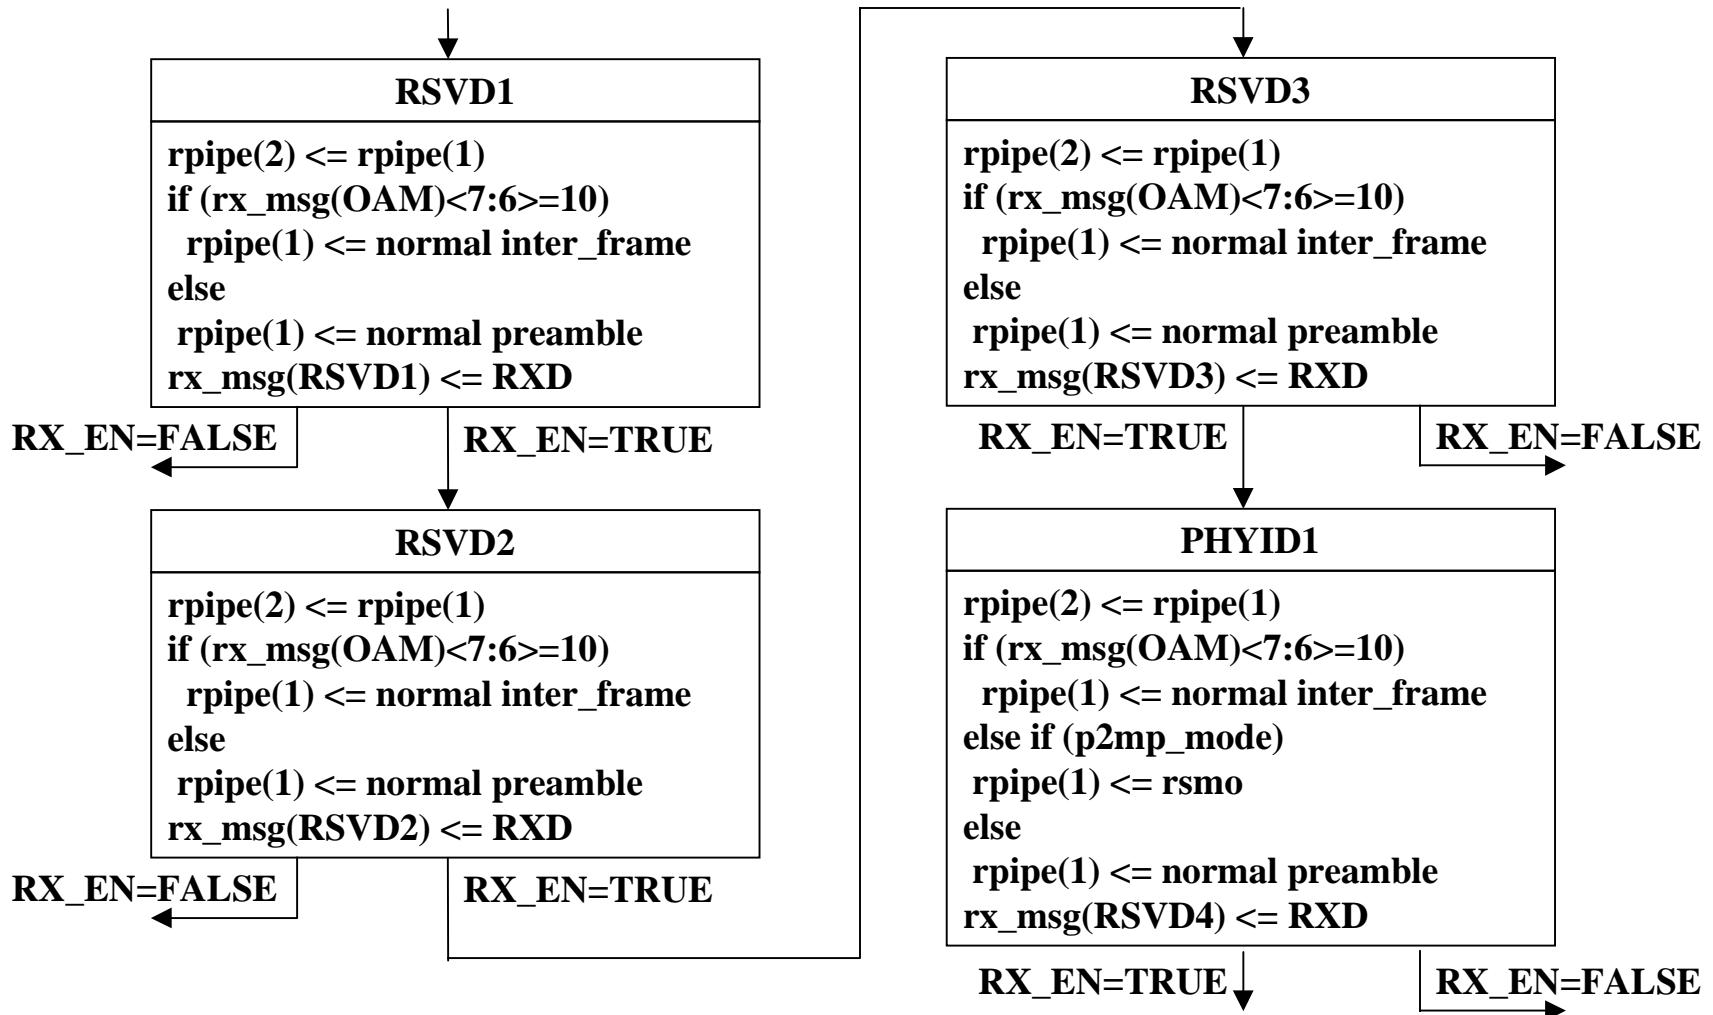

# RX OAM State Machine (page 1)

(from states on next pages)

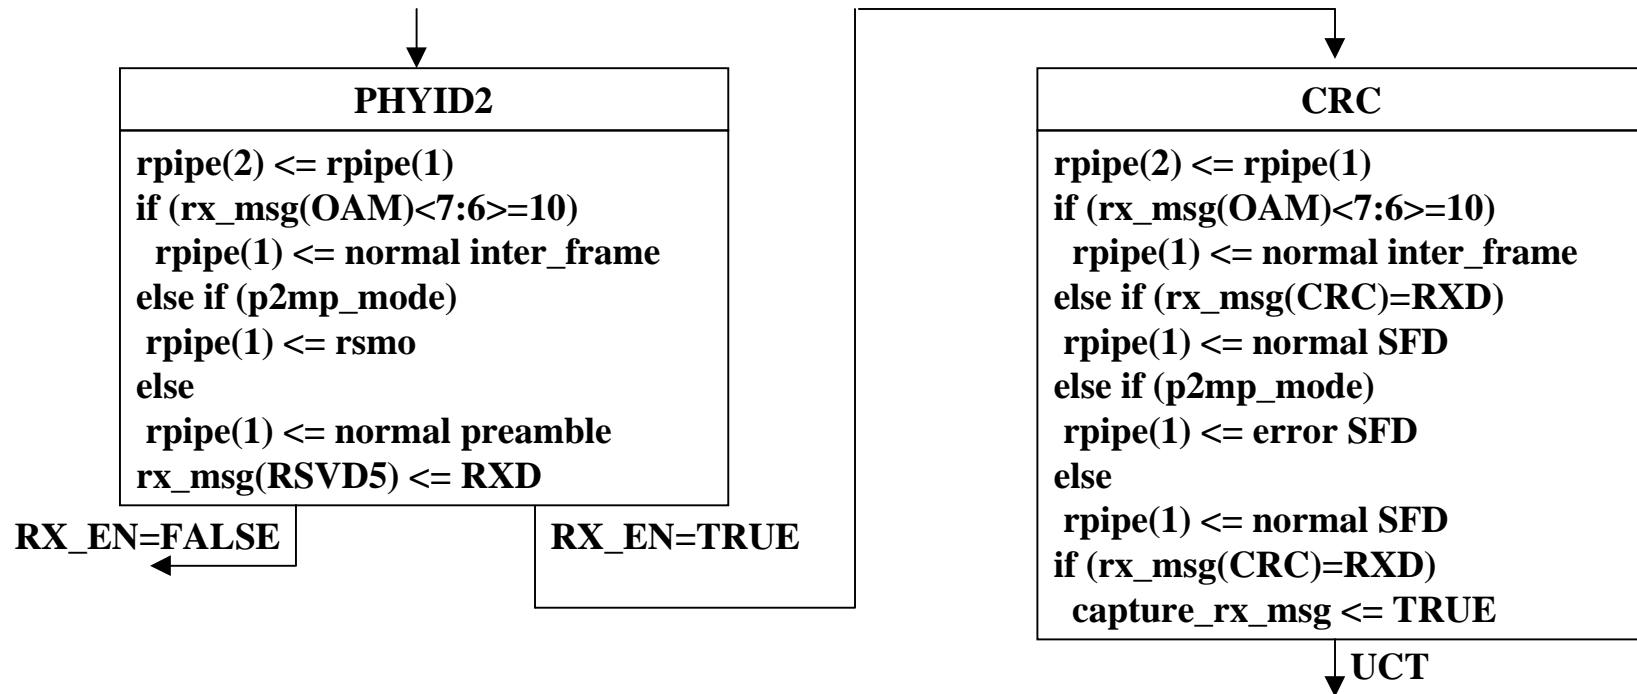

power\_on=TRUE + Note: All transitions synchronous to RX\_CLK  
mr\_main\_reset=FALSE

# RX OAM State Machine (page 2)

# RX OAM State Machine (page 3)

# RX OAM Variables

- **rsmo - Receive State Machine Output**

The 10-bit vector output from the Receive State Machine and used by the RX OAM state machine. When Receive OAM is not enabled, rsmo is the source of RX\_ER, RX\_EN & RXD<7:0>.

- **rpipe(#)** - RX Pipeline Stage #

A 10-bit vector that reflects the contents of a particular stage of the receive pipeline. #=1 & 2 where 1 is the first stage of the transmit pipeline and 2 is the last. Both stages are directly controlled by the RX OAM state machine. The reset value of rpipe(#) is normal inter\_frame.

When Receive OAM is enabled, rpipe(2) is the source of RX\_ER, RX\_EN & RXD<7:0>.

# RX OAM Variables

- **rx\_msg(x)** - RX OAM Message

**x** consists of OAM, RSVD1, RSVD2, RSVD3, RSVD4, RSVD5, CRC

Contains the RX OAM message to be inserted in the place of a packet's preamble or inserted into the IDLE stream.

OAM - OAM byte from (insert reference here)

RSVDx - RSVD bytes from (insert reference here)

CRC - CRC8 of RX OAM message from (insert reference here)

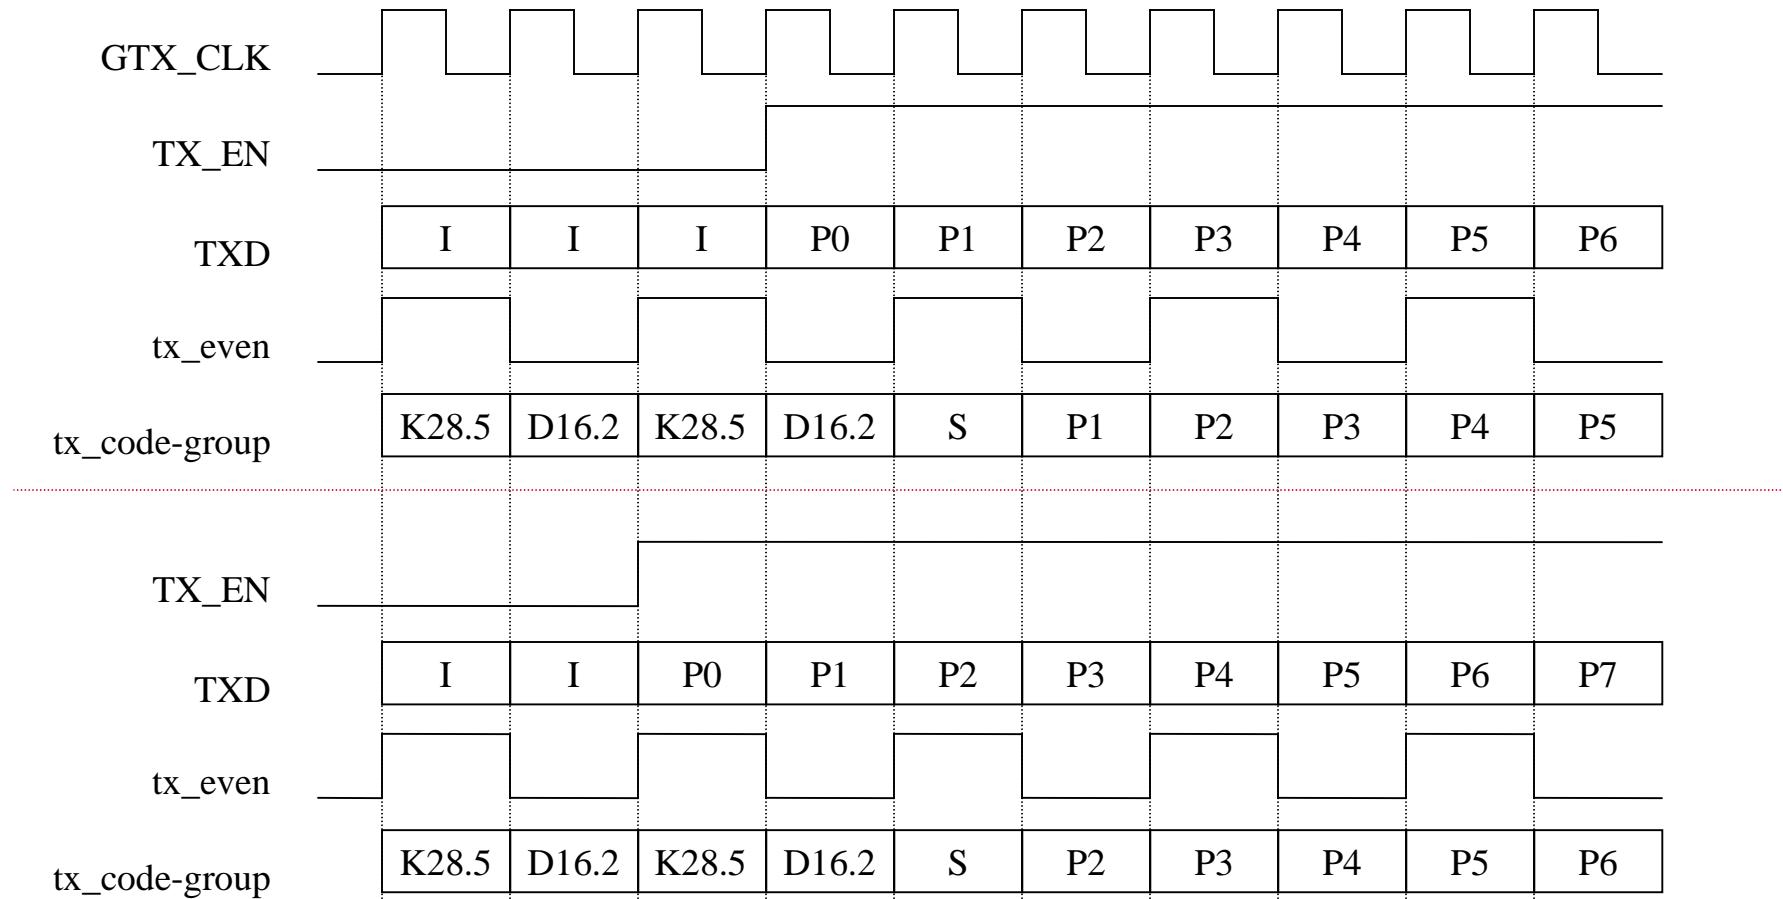

The CRC parameter is expected to be continuously calculated so after all other parameters have been written, the CRC parameter can be used to determine if the received CRC is valid.

- **capture\_rx\_msg**

Indication to the Message Handler that an OAM message is available in rx\_msg and should be captured.
