

This applies to clause:
61.2.3.3.1
61.2.3.3.2

Problem:

If the receiver drops out of frame prematurely because of an error, the next good frame likely suffers errors in the first three bytes while the CRC indicates the frame is error free.

Either solution is acceptable:

- 1) Remove the scrambler/descrambler combination
- 2) Initialize the scrambler/descrambler memory to zero prior to the beginning of each frame.
