

# 802.5t/D1 Comment Report

802.5/98/03-07r3

## Comment RDL-11

Section 0.0 Line 1 Severity A/C Type ED Status MODIFIED

Highlight To Committee ☐ Commenter Agrees? ☒ Editing Complete ☐

Concern: Missing Annexes,

Solution: Annexes L, and M must be updated (since these are informative annexes, this comment is A/C)

Response: This will be done in the May release of the document.

## Comment RDL-12

Section 0.0 Line 1 Severity A/C Type ED Status ACCEPTED

Highlight To Committee ☐ Commenter Agrees? ☒ Editing Complete ☒

Concern: Annex O should be re-named

Solution: Add a page after Annex M stating: "Change Title of Annex O to Channel considerations for 16 Mbit/s Token Ring."

Response: RDL does this.

## Comment RDL-10

Section 0.0 Line 1 Severity DIS Type TECH Status ACCEPTED

Highlight To Committee ☒ Commenter Agrees? ☒ Editing Complete ☐

Concern: Global Concern, Annex A, conformance requirements have not yet been specified.

Solution: Each Clause editor should extract appropriate requirements and indicate where in Annex A they belong.

Response: Done (Neil to do).

## Comment RDL-01

Section 1.0 Line 2 Severity A/C Type ED Status ACCEPTED

Highlight To Committee ☐ Commenter Agrees? ☒ Editing Complete ☒

Concern: The title does not state the purpose.

Solution: Add after "supplements" "to support 100 Mbit/s DTR operation"

Response:

## Comment RDL-16

Section 1.0 Line 2 Severity A/C Type ED Status ACCEPTED

Highlight To Committee ☐ Commenter Agrees? ☒ Editing Complete ☒

Concern: This supplement needs a statement of scope

Solution: Add an introductory paragraph 1.0 which specifies the purpose and scope of this Supplement

Response:

---

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** MAC Protocol should be labeled "(9.1, 9.2)" instead of "Clause 9.6".

**Solution:** Change "Clause 9.6" to "(9.1, 9.2)".

**Response:** Do it.

## Comment KTW-07

Section 2.1 Line 1 Severity DIS Type TECH Status ACCEPTED

Highlight To Committee ☒ Commenter Agrees? ☐ Editing Complete ☐

**Concern:** Figure on page 2-1 as it relates to "Interface signals" and their useage in 9.2, 9.3 and their definitions in 9.8.

There is TOTAL confusion as to how MAC transmits data and idles. MAC is either transmitting frame data or idles. The confusion relates to what happens when FxTI is set to a 0 (no fill) or 1 (fill) and was caused by a pre-release version of the Draft 1 subclause 9.8 which I reviewed, but was changed before it was released without my knowledge.

I will comment on 9.2 below, but the same problem exists in 9.3.

GIVEN:

When in TS=STXN, the transmission of idles is turned ON (FSTI=1). When TS=STXN recognizes the need to transmit a frame, the following occurs.

Upon exit from the TS=STXN state and BEFORE entry into the TS=STXD state, the transmission of idles is turned OFF (FSTI=0), the transmit of SFS occurs and then the TS=TSXD state is entered to transmit the frame's data occurs until EOD is reached.

When TS=STXD recognizes the EOD, the following occurs.

Upon exit from the TS=STXD state and BEFORE entry into the TS=STXN state, the EFS is transmitted, the transmission of idles is turned ON (FSTI=1) and then the TS=TSXN state is entered.

Now a description of the problem.

- 1) Draft 1 9.2 table 9.2-5 (page 9.2-33) uses PM\_CONTROL.request(Transmit\_mode=Fill) OR PS\_CONTROL.request(Transmit\_mode=Fill) to turn ON the transmission of idles (FSTI=1) [implementers choice], and PM\_CONTROL.request(Transmit\_mode=No\_fill) OR "PS\_CONTROL.request(Transmit\_mode=No\_fill)" to turn OFF the transmission of idles (FSTI=0) [implementers choice]. This change was made at the request of the committee to bring 4, 16 and 100 Mbit/s in line with each other.

However, this DISAGREES with 9.8.1.1.2 lines 105 through 117.

- 2) To confuse the issue even more, the precise specifications in 9.2.5.8.2 on page 9.2-45 at 100 Mbit/s agrees with 9.8 (got caught between 9.8 releases) and uses the PS\_UNITDATA.request[Tx\_symbol=Idle] signal to transmit idles and the PS\_UNITDATA.request[Tx\_symbol=Data\_byte] signal to transmit data.

Note: The references are incorrect because I used the pre-release Draft 1 subclause 9.8 organization.

Furthermore, at 4 and 16 Mbit/s, the "PS\_CONTROL.request" OR "PM\_CONTROL.request" signals are used [implementers choice].

Both can't be right, so which is correct? I think the "CONTROL" Interface is correct (see solution).

Also, when would PM\_UNITDATA.request be used at 100 Mbit/s (see Tam Ross' comment on page 9.8-3 lines 97-103)?

Finally, I have opened many items relating to this item with each of these items referring to this item.

**Solution:** What we need is a clear and concise definition of how the Station and C-Port transmit "idles" and "data" and which Interface signals are used at 4, 16 and 100 Mbit/s.

This needs discussion by the committee so I know how to change 9.2 and 9.3 and Andy (?) knows how to change 9.8. The following items need discussion:

- 1) How to define transmit as it relates to FxTI (Station and C-Port) for control over idles.
- 2) How to define transmit as it relates to the transmission of data.
- 3) We must again discuss how 4 and 16 Mbit/s is changed (current DTR standard uses PM\_CONTROL.request, but with different words). Do we want to change it since it changes the BASE 1998 and the DTR Supplement standards?

DISCUSSION of item 1.

The implication of "PS\_UNITDATA.request..." is one of supplying "data" via the "MII data bits" to be transmitted. However, "fill" is not data that is derived from the "MII data bits" (Note: Even though data must be provided to the MII data bits, these bits are ignored.), but rather a special MII signal.

Therefore, I believe the correct terms for the "control" of fill are:

- 1) "PM\_CONTROL.request(Transmit\_mode=Fill)" OR "PS\_CONTROL.request(Transmit\_mode=Fill)" [implementers choice] to turn ON the transmission of fill and
- 2) "PM\_CONTROL.request(Transmit\_mode=No\_fill)" OR "PS\_CONTROL.request(Transmit\_mode=No\_fill)" [implementers choice] to turn OFF the transmission of fill.

This would agree with the decision the committee made during the January meeting in York and with 9.2 table 9.2-5 (page 9.2-33).

Finally, when "fill" is turned OFF (FxTI=0) "data" is supplied but not used. Therefore, in my opinion, it makes more sense to use a "CONTROL" type Interface signal than a "UNITDATA" type Interface signal.

DISCUSSION of item 2.

Paper 802.5/1998/03-04 is a presentation outlining a new 9.1.1.1 definition for the transmit function. This paper has been written as if this item was accepted. If this item is not accepted, the proposal's needs to be changed to include the names of the appropriate Interface signals used to turn on and off idle transmission.

DISCUSSION of item 3.

I have no problem changing the BASE and Supplement standards provided the committee agrees it is the right thing to do and it is allowed by our PAR.

**Response:** KTWilson to do.

---

**Comment** KTW-06

**Section** 2.1    **Line** 1    **Severity** A/C    **Type** ED    **Status** ACCEPTED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** C-Port should be labeled "(9.2, 9.3)" instead of "Clause 9.3".  
9.2 should be included because it defines the "C-Port in Station Emulation Mode".

**Solution:** Change "Clause 9.3" to "(9.2, 9.3)".

**Response:** Do it.

---

**Comment** KTW-05

**Section** 2.1    **Line** 1    **Severity** A/C    **Type** ED    **Status** ACCEPTED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** PMC should be labeled "(9.7, 9.8)" instead of "Clause 9.8".  
9.7 should be included since, at 100 Mbit/s, it defines PM\_STATUS.indication for Phantom detect.

**Solution:** Change "Clause 9.8" to "(9.7, 9.8)".

Question: Should a block labeled "Phantom Detect" be added to PMC?

**Response:** Do it.  
Answer: Yes.

---

**Solution:** Committee discussion required

**Response:** This is used for cut-through and is required.

## Comment NAJ-66

Section 09.1 Line 213 Severity DIS Type TECH Status MODIFIED

Highlight To Committee ☒ Commenter Agrees? ☒ Editing Complete ☐

**Concern:** Considering the definitions of a frame with error in 9.1.1.6:

- 1) The property R of a frame

R - Ends with a valid ESD /T/R

cannot be tested in an implementation using the MII interface as it is impossible to distinguish a code violation in the final nibble from a premature end-of-frame. Both result in the final nibble on the MII receive interface having RX\_ER asserted.

In a valid frame (FR), we also have condition P

P - Has no code violations between SSD and ESD

and in this context property R is testable. But in a frame with error (FR\_WITH\_ERR), property R is not testable when the final data nibble with RX\_DV asserted has RX\_ER asserted as this may indicate a code violation preceding a valid /T/R/ sequence or a premature end-of-frame with /I/I/ seen an no /T/R/ sequence.

- 2) A frame that doesn't end in a /T/R/ at 100 Mbit/s should be treated in a similar manner to a 4/16 Mbit/s frame with no ED. In particular, it should not be a FR\_WITH\_ERR.
- 3) An aborted frame (ending with RX\_ER asserted for two nibbles) should also be treated in a similar manner to a 4/16 Mbit/s aborted frame. In particular, it should not be a FR\_WITH\_ERR.

The following sequences may clarify my understanding of the problem. Hexadecimal symbols are shown with token ring (MSB first) encoding.

Frame 1 - A valid frame

```
Rx:      |AC |FC |      |      FCS      |ET |
         /J/K/1/0/4/0/ ... /a/a/a/a/a/a/a/a/0/0/T/R/

RXD<0:3>  |A|A|1|0|4|0| ... |a|a|a|a|a|a|a|a|0|0|
RX_DV _____|_____|_____
RX_ER _____|_____|_____
```

Frame 2 - A frame with no TR sequence

```
Rx:      |AC |FC |      |      FCS      |ET |
         /J/K/1/0/4/0/ ... /a/a/a/a/a/a/a/a/0/

RXD<0:3>  |A|A|1|0|4|0| ... |a|a|a|a|a|a|a|a|0|x|
RX_DV _____|_____|_____
RX_ER _____|_____|_____
```

Frame 3 - A frame with a code violation in the final nibble

```
|AC |FC |      |      FCS      |ET |
```

```

Rx:      /J/K/1/0/4/0/   ...   /a/a/a/a/a/a/a/a/0/V/T/R/
RXD<0:3>  |A|A|1|0|4|0|   ...   |a|a|a|a|a|a|a|a|0|x|
RX_DV _____|_____|_____
RX_ER _____|_____|_____

```

Frame 4 - An aborted frame with two code violations

```

Rx:      |AC |FC |   ...   |      FCS      |ET |
         /J/K/1/0/4/0/   ...   /a/a/a/a/a/a/a/a/H/H/T/R/
RXD<0:3>  |A|A|1|0|4|0|   ...   |a|a|a|a|a|a|a|a|x|x|
RX_DV _____|_____|_____
RX_ER _____|_____|_____

```

The MII representations of frames 2 and 3 are identical but frame 3 is supposed to be a FR\_WITH\_ERR and frame 2 is not supposed to be.

**Solution:** Changing the definition of R to be:

R' - Ends with a valid hexadecimal digit followed by a valid ESD signal (code symbols /X/T/R/)

addresses all these problems.

An alternative is to require both nibbles of the ET octet to be valid hexadecimal values:

R'' - Ends with two valid hexadecimal digits followed by a valid ESD signal (code symbols /X/X/T/R/)

I personally think R'' is preferable. It looks cleaner as a specification with the end of FCS coverage switching immediately to the no-violations ruling of the ET/ESD. It may also offer a small amount of protection against transmission errors hiding an abort sequence.

A corrected definition of frame with error (FR\_WITH\_ERR) would then be one of the following conditions [This includes other corrections from previous NAJ comments]:

E & N & R' & L & (-C or -P or -F or -Q)  
or -E & N & R' & L & (-C or -P)

R' or R'' can be used instead of R in the definition of a valid frame (FR) with no change of semantics.

It may be noted that at 4/16 Mbit/s, a code violation in the I, E, A and C bits does not affect the conditions for FR, or FR\_WITH\_ERR. The current 100 Mbit/s standard says that a code violation in ET will turn a FR into a FR\_WITH\_ERR and this proposal will turn a FR with a code violation in ET into a sequence that is neither a FR nor a FR\_WITH\_ERR.

**Response:** Changed the definition of R as follows.

R - Ends with two valid hexadecimal values (0 through F) followed by a valid ESD signal (code symbols /T/R/)

Highlight To Committee ☐    Commenter Agrees? ☒    Editing Complete ☒

**Concern:** Previous change means verb doesn't agree with subject/object.

**Solution:** Change "causes" to "cause".

**Response:** OK. Since this is the original set of words, change bar has been removed.

---

**Comment** MJH-06

Section 9.1    Line 955    Severity Q    Type ED    Status REJECTED

Highlight To Committee ☒    Commenter Agrees? ☒    Editing Complete ☒

**Concern:** General question: We include full references to other documents within the text of our clauses. Would it be easier for the editors to have a reference section at the start that has the full reference (i.e. [8802-5] - ISO/IEC 8802-5:1998) and just refer to [8802-5] within the text. This would mean only one item has to be changed when the referred document name changes.

**Solution:**

**Response:** Good point, but why change now and introduce errors?

---

**Comment MJH-07**

**Section** 9.1    **Line** 964    **Severity** Q    **Type** ED    **Status** MODIFIED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Should this section include a reference to Figure 9-1?

**Solution:**

**Response:** Changed line 6, which identifies configurations 1 through 4, as follows.

FROM:

"... configurations 1 through 4. ..."

TO:

"... configurations 1 through 4 illustrated in Figure 9.1. ..."

Is this acceptable?

---

---

**Comment NAJ-42**

**Section** 9.2    **Line** 470    **Severity** DIS    **Type** TECH    **Status** ACCEPTED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☒

**Concern:** Ref 3210 & 3211, 9.2-26 & 9.2-27 \*also\*  
Ref 1202 & 1201, 9.3-25

Action contains CSBTX=13 for high media rates. My calculation of the value is

IFG + SSD + AC + FCS + ET + ESD, which is  
12 + 1 + 1 + 4 + 1 + 1 = 20 (14 hex) for high media rates.

**Solution:** Change 13 to be 14.

**Response:** Changed 3210, 3211, 1202 and 1201 to agree with solution.

---

**Comment NAJ-40**

**Section** 9.2    **Line** 470    **Severity** Q    **Type** TECH    **Status** OPEN

**Highlight To Committee** ☒    **Commenter Agrees?** ☐    **Editing Complete** ☐

**Concern:** Has FPASO become overloaded. I can envisage a cobbled together 4/16/100 Mbit/s implementation, which uses FPASO=0 at 4/16 (since FPASO=1 is discouraged at 4/16), and uses FPASO=1 at 100Mbit/s (maybe because of RMII).

Is this a problem?

Also 9.3 issue.

**Solution:**

**Response:** Ken Wilson and Neil Jarvis will evaluate FPASO before the release of Draft 2.

---

**Comment MJH-10**

**Section** 9.2    **Line** 470    **Severity** Q    **Type** ED    **Status** ANSWERED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☒

**Concern:** S/T TABB ref 3210. This refers to PPV(MAX\_TX). This is not defined anywhere in 9.2. (Define in 9.3.2). Should some definition be included in 9.2? (Base document problem as well)

**Solution:**

**Response:** "FR\_LTH<=PPV(MAX\_TX)" has been defined in 9.2.5.8.2 (on Draft 1 page 9.2-44 after DTU\_UNITDATA.indication), changed the C-Port definition (page 9.3-35) to agree with Station's precise definition for events and added this missing C-Port's precise definition for actions (Draft 1 page 9.3-44 after [FA(address)=1]).

Also, found "FR\_LTH<=MAX\_TX" which is not used. Corrected this to "FR\_LTH<=SPV(MAX\_TX)" (Draft 1 page 9.2-41).

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** On page 9.2-45, "PM\_CONTROL.request(Repeat\_mode=Repeat)" is the subject of KTW-7.

**Solution:** If suggestion made in KTW-7 is accepted, make the following changes.

- 1) "PM\_CONTROL.request(Repeat\_mode=Repeat)" to  
"PM\_CONTROL.request(Transmit\_mode=No\_fill)".
- 2) Remove "<< 4 and 16 Mbit/s only >>".
- 3) Change the meaning of this term to the following.  
The C-Port PMAC requests the PMC to stop sourcing fill  
and start repeat (see 9.7.2.2 for 4 or 16 Mbit/s, or  
9.8.? For 100 Mbit/s).

Note: 9.8.? needs to be filled in when 9.8 is  
changed as per KTW-7.

If KTW-7 is not accepted, a different change will be required.

**Response:** KTW-7 was accepted so do it. Leave Editing Complete unmarked until get 9.8.? is assigned.

**Concern:** Title is wrong. "Draft 0.5 Nov 1997".

**Solution:** Fix next time.

**Response:** Done.

---

**Comment IMJ-14**

**Section** 9.3    **Line** 1    **Severity** Q    **Type** TECH    **Status** OPEN

**Highlight To Committee** ☐    **Commenter Agrees?** ☐    **Editing Complete** ☐

**Concern:** REF 1060, 1055, 1059, 1082, page 9.3-19.  
1) Why not use TXI\_RMV\_ALRT when VC=00?  
2) Why not use TXI\_RMV\_ALRT when JS=PDAC?

**Solution:**

**Response:** TXI\_RMV\_ALRT should be sent after the C-Port has entered Join Complete. Therefore,  
1055 needs to be changed and eliminates changing 1060 and 1082. However, 1059 is  
another question since JS=PLT can be entered as the result beaconing after Join  
complete. It is my opinion that it should not do the transmit remove alert  
function.

Will evaluate correction as per NAJ-34.

**Comment SJH-47**

**Section** 9.3    **Line** 128    **Severity** DIS    **Type** TECH    **Status** MODIFIED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** "flag is set to 1 on the receipt of any frame, or optionally, token." Does this mean that an implementation could choose to set the flag only on a token? If so, it won't disrupt a tokenless lobe test, as is optionally allowed at 4/16. Even if the open were disrupted further down the process, the open failure to management may be different.

In the state transition tables, the notation TK\_AC suggests that both Frame and Token are mandated (since the T bit of the AC isn't specified).

**Solution:** If token-only flag setting isn't allowed, change "frame, or optionally" to "frame, and optionally".

**Response:** Flag FPBLT is set to 1 upon receipt of any frame or, optionally a token. Line 128 changed as follows.

FROM:

"... receipt of any frame, or optionally, token. ..."

TO:

"... receipt of any frame and optionally any token. ..."

Ken Wilson: any frame=FR\_AC (9.1.x.x) and any token=TK\_AC (9.1.x.x). Therefore, write new words.

---

**Comment NAJ-53**

**Section** 9.3    **Line** 358    **Severity** DIS    **Type** TECH    **Status** MODIFIED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Ref 1122, 9.3-16

See NAJ-35. This transition shows a clear problem with the remove alert process. 1122 fires and causes a RMV\_ALERT MAC frame to be transmitted. When this completes, and TS returns to PTXN, 1122 fires again, restarting the RMV\_ALERT process.

**Solution:** Some sort of mechanism (like bypass wait) that stops the remove alert process being restarted or interrupted.

**Response:** NAJ-34 will probably require either a new state or flag (to simulate a state) and will resolve this problem.

---

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Received codeviolation errors is not returned to the Station, when using MII repeat path.

**Solution:** The elastic buffer must include RX\_ER to TX\_ER connect.

**Response:** The base standard does not require that specific knowledge of where errors have occurred be available, only that of how many have occurred.

The proposed solution would only provide information on error location for the specific example of a physical repeat path at the MII to MAC interface. Information gained by including RX\_ER to TX\_ER connect here would still not be available using the other examples given, i.e. deeper inside the MAC layer.

See IMJ-02. We do need to define how RX\_ER is synchronised to TX\_ER. Also need to talk about how RX\_DV is synchronised to TX\_EN.

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** The statement about PSC may or may not be true depending on the outcome of the current discussions on fiber involving the scrambler.

**Solution:** Revise sentence appropriately when scrambler question settled.

**Response:** Line 15 is talking about the PSC and not the PMC. As such it is absolutely correct.  
See also response to KR-09.

---

**Comment MJH-13**

**Section** 9.8    **Line** 21    **Severity** Q    **Type** ED    **Status** MODIFIED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Would [802-3u] be a better abbreviation? (regardless it should be -3 rather than .3)

**Solution:**

**Response:** The specification is:

IEEE Std 802.3u-1995  
(Supplement to ISO/IEC 8802-3: 1993  
[ANSI/IEEE Std 802.3, 1993 Edition])  
Recognised as an American National Standard (ANSI)

So, I would suggest that the abbreviation should be [802.3u].

This reminds implementers to which specification they are being referred whilst being usefully short.

Note that this change will require all instances of references to [802.3] to be changed.

From Bob Love: It should as Andy has stated be [802.3u] and not [802-3u].

---

**Comment KR-06**

**Section** 9.8    **Line** 48    **Severity** DIS    **Type** ED    **Status** MODIFIED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** This statement implies that the existing mechanism used for 4/16 may not change. This is not true.

**Solution:** Remove line 48.

**Response:** I agree that the wording is unclear.

However, the key point is the use of the phrase 'as closely as possible'.

It doesn't prohibit changes to the 4/16 Mbit/s signalling interface.

Andy, please use second modification, agreeable to commenter:

"Maintain the equivalent of the existing 4/16 Mbit/s 802.5 signalling interface."

If KTW-7 is not accepted, a different change will be required.

**Response:** Accepted subject to acceptance of KTW-07.

## Comment KR-11

Section 9.8    Line 343    Severity Q    Type TECH    Status ANSWERED

Highlight To Committee ☒    Commenter Agrees? ☒    Editing Complete ☐

**Concern:** Were we going to add a clarification on the crystal tolerance? I thought that we were going to specify a 50ppm or 100ppm oscillator which may or may not be specified by 802.3. This was discussed at HSTRA tech 2 or the november plenary (can't find it in the minutes!). Note that this would also apply to fiber operation.

**Solution:**

**Response:** Note that the line reference 343 appears to be incorrect. Is this the Draft line number?

That aside though, the question of crystal tolerance is actually that of transmit clock frequency tolerance.

802.3u has this to say:

'24.2.3.4 Timers

code-bit\_timer

In the Transmit Bits process, the timer governing the output of code-bits from the PCS to the PMA and thereby to the medium with a nominal 8 ns period. This timer shall be derived from a fixed frequency oscillator with a base frequency of 125 MHz  $\pm$  0.005% and phase jitter above 20 kHz less than  $\pm$  8°.'

In our section 9.8, lines 60-61 say (corrected to remove the spurious text, 'PS\_UNITDATA.indication' at the end of the paragraph):

'In the following, a nibble is a 4-bit interface, exchanged with the MAC at a 40 ns time interval. The nibble clock shall have a tolerance of plus or minus 50 ppm or better.'

and lines 253-259 say - with a number of typos - :

9.8.1.4 Media Independent PHY Specifications (PCS)

The PSC shall meet all requirement of [802.3] Clause 24: Physical coding sublayer (PCS) and physical medium attachment (PMA), type 100BASE-X. The MII, if exposed, shall meet all applicable requirements of 802.3 Clause 22: Reconciliation sublayer and media independent interface. In [802.3], informative annexes 21, 22, 23, 27, and 28, with exceptions listed below, provide additional information useful to PMC sublayer implementers. Where there is conflict between specification in [TP-PMD] and those in this standard, those of this standard shall prevail.'

If we add some words to 9.8.1.4 like those quoted from 802.3u 24.2.3.4 above, about the line transmit bits clock period, and reword lines 253-259 to correct the wording of the sub-section heading, remove the reference to a non-existent Annex 21 and then modify the reference to [TP-PMD] something like as shown below then I think that will clarify things.....

.... Even if this response doesn't!

Proposed replacement text:

9.8.1.4 Media Independent PHY Specifications (PSC)

The PSC shall meet all requirement of [802.3] Clause 24: Physical coding sublayer (PCS) and physical medium attachment (PMA), type 100BASE-X. The MII, if exposed, shall meet all applicable requirements of 802.3 Clause 22: Reconciliation sublayer and media independent interface, with the exception as described in sub-section 9.8.1.1 lines 60-61 above. In [802.3], informative annexes 22, 23, 27, and 28, with exceptions listed below, provide additional information useful to PMC sublayer implementers. Where there is conflict between specification in [802.3] clauses 22 and 24, [TP-PMD] or [FO-PMD] and those in this standard, those of this standard shall prevail.'

**Comment RDL-09**

**Section** 9.8    **Line** 368    **Severity** A/C    **Type** ED    **Status** ACCEPTED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Fibre Optic Changes should be reflected in Clause 13 (the true clause 13, not the misname clause 14).

**Solution:** Find the proper place in Clause 13 to include the fibre optic information. It may also stay here if appropriate.

**Response:** I don't understand what RDL-08 refers to. Hence, this rejection may be subject to review depending on quite what the outcome is of discussing RDL-08!

Allowing for that:

Apart from the obvious difference of the media type, the differences between twisted pair and fibre media operation are that fibre does not use scrambling (today) or MLT-3 coding, whereas twisted pair does.

These are differences in the PMC sub-layer.

As such, the specification of these PMCs within section 9.8, is correct. Therefore the changes to the respective source specifications (FO-PMD & TP-PMD) also belong within section 9.8.

Dear Andy, first the clause 13 in the comment refers not to Neil's clause 13 (which should be 14), but to the fibre clause to be published in IEC/ISO 8802-5:1998/Amd 1:1998 (Still with me?)

The bad news is that you now need to update clause 13 (the real one), and put a reference in 9.8 to the new fibre information contained within that update.

So 9.8.1.6 should be in 13. (Your job to figure out where). Put a reference in 9.8.1.6 to this new section.

It gets worse. We don't have clause 13! So it will probably be published as a new 13 subclause (no need to republish the whole clause).

Talk to Bob Love.

Love and kisses,

802.5

**Concern:** The standard should not denote preference to a certain type of connector.

**Solution:** Remove sentence in line 392.

**Response:**

---

**Comment KR-09**

**Section** 9.8    **Line** 402    **Severity** DIS    **Type** TECH    **Status** REJECTED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Use of scrambler with fiber is still an open issue.

**Solution:** Add note of this to standard.

**Response:** Note that the line reference 402 appears to be incorrect. Is this the Draft line number?

That aside, the use of the scrambler with fibre will further restrict the implementers choice of PHY devices.

One of the declared aims of this standard (in line 45) is to provide an easy and cheap upgrade path by leveraging the mass market success and availability of Fast Ethernet components.

There are already restrictions due the specific implementations of scrambler synchronisation timers for twisted pair operation: can we not place further restrictions on implementers.

----

This needs to be researched by other PHY experts in the committee. Answers are required for:

- 1) Why did 802.3 turned off the scrambler?
- 2) What benefit does it really give you?
  - + Better BER measurement
  - + Can't cross-connect TR to ETH
  - + EMI benefits at the tranceiver
  - Requires testing by other people to verify this data.

Karl will go and get more information, and will consider re-opening this comment on draft 2.0

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** CAPITALIZATION : Sorry. At some time some poor sod is going to have to explain to a bewildered IEEE editor that we have certain phrases that must be capitalized as that gives them meaning. The editor will then respond, "well look, you didn't capitalize it here, or here..or over there..". Now should "bypass" and "bypass state" be capitalized or not? Given we are remarkably consistent in the document using Bypass State, Bypass state and now bypass state. (and, when used alone, should Bypass be Bypass or bypass or even ByPass for C++ chaps)

**Solution:**

**Response:** I will remain consistent with the rest of the document. Bypass should be written as "... Bypass state ...".

**Concern:** Doesn't make sense.

**Solution:** Add "and" after comma: "...requirements of the Station and C-Port, and the receive..."

**Response:** Do it.

---

**Comment** DWW-11

**Section** 13.3    **Line** 178    **Severity** DIS    **Type** TECH    **Status** ACCEPTED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** Confusion exists as to what 'Station' means as opposed to 'station'. As I understand it, 'Station' means station or C-Port in station emulation mode and 'station' means station. If this is correct then the sentence means:  
"A station or C-Port in station emulation mode or a C-Port in station or C-Port in station emulation mode emulation mode ..."  
which is garbage.

Alternatively, if the definitions are swapped then there are numerous missing references to C-Ports in station emulation mode in clause 9...

**Solution:** The committee needs to agree the meaning of "station" and "Station" and document this within the standard.

The text of the standard then needs to be checked throughout to ensure that the correct term has been used consistently

**Response:** Replace "A Station or a C-Port in Station Emulation Mode ..."  
with "A DTR station or a C-Port in Station Emulation Mode ..."

Go find the original concern, resolution and vote taken to use Station...

**Section** 13.4    **Line** 198    **Severity** DIS    **Type** TECH    **Status** MODIFIED

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** This timer has been given two different meaning. This was thought desirable since they never run at the same time. However, it requires both timers to have the same time increment.

Our implementors disagree with this. They fail to see why the time-out value while waiting for a Lobe Test MAC frame needs to be 20 ms.  
They feel that 200 ms is more realistic since only a maximum of two of these occurrences can occur, but only one of these matters (since the second one is going to cause failure).

**Solution:** Break this timer into two timers, one for pacing and one for time-out.

If this item is accepted, then changes are needed in 9.2 state table 9.2-7.

**Response:** Agree to two timers.  
Ken to talk to implementors again, about changing 20ms to be 200ms. [Withdrawn from comment]  
Neil to create new informative annex with presentation 01-05 to show lobe media test timing analysis.

**Comment** KTW-34

**Section** 13.5    **Line** 249    **Severity** DIS    **Type** TECH    **Status** ACCEPTED

**Highlight To Committee** ☒    **Commenter Agrees?** ☒    **Editing Complete** ☐

**Concern:** We have a problem with a frame size of 18.2K.

Only a few PHY vendors can actually handle this frame size since most default to having a 1 ms "idle detect timer" (instead of the 1.8 that 18.2 requires). This 1 ms timer limits frame size to around 12K.

Several methods exist to resolve this problem, but each needs discussion as to advantages and disadvantages.

For example:

1. Keep frame size at 18.2K and require PHY vendors to change (this could delay parts availability)?
2. Limit frame size to 12K?
3. Add to the Registration process to determine what frame size is supported by the link?
4. Others not listed.

**Solution:** Discussion is required in March. Also see KTW-35.

**Response:** In clause 9.8 (9.8.1.5.8?), mandate that the PHY shall support 18200 octets. Remove reference to idle timer. No PICS entry. Modify Annex U in the same manner (e.g. remove timer value).

Committee to decide which solution to adopt. (Thursday)

Accepted by straw poll 03-04.

**Highlight To Committee** ☐    **Commenter Agrees?** ☒    **Editing Complete** ☒

**Concern:** This sentence basically says the analysis in the annex is based on false assumptions and inaccurate, but hell we'll use it anyway.

It does not give any confidence that the values produced are correct or a sound basis for the lobe test requirements.

If the analysis is valid then the document should justify it. If it is invalid then the annex should be rewritten or removed as it is not helpful.

**Solution:** Fix it

**Response:** New words: "Note that Bit Error Rate, expressed quantitatively for Token Ring Network Links, is an artificial construct used to provide an estimator of the number of transmitted frames that are expected to be received in error because of noise. For complex coding the term is artificial and provides only an approximation to the actual error rate.inaccurate. However, since we are looking to distinguish between bit error rates which differ by an order of magnitude or more from each other, this approximation is adequate., but still useful. In fact, t The analysis below, based on this artificial construct, provides a useful estimator for the frame error rate, even though noise errors may not produce single bit errors. "
